Executive Summary

This assessment of the European retail order-to-cash process found that credit decisions are being made against a credit view that diverges materially from the designated system of record across 267 accounts, while the channel carrying two-thirds of order value runs with no documented owner.

€59.7M	67.3%	3	3	12
Electronic channel order value	Electronic channel share by count	issues identified	opportunities mapped	sources analysed

The situation

Two customer systems hold conflicting credit limits and payment terms, and order releases can draw on the higher, non-authoritative figure. The electronic ordering channel — 67.3% of orders — sits outside the formal procedure and accountability matrix, and its orders fail to fulfil at nearly four times the rate of manual orders, generating repeated escalations and delisting threats.

The opportunity

The greatest early value lies in two foundational moves with no prerequisites: bringing credit decisions onto a single trusted view with a controlled approval step, and assigning documented ownership of the electronic channel. With those in place, automated early detection of at-risk electronic orders can prevent failures before they reach customers.

What we read

Customer Service Escalation Log 2025, Order Flow Analysis Export 2025, SAP CRM Customer Export, SAP S/4HANA Customer Master Export, Accounts Receivable Review Notes Q4 2025, Credit Management Policy Europe, EDI Dispute Resolution CS Working Notes, EDI Integration Register Europe and 4 more. Every figure in this assessment is computed from these sources and traces back to them.

Read on: the Current State, the issues found, and the recommended opportunities.

1. Current State Assessment

How Order-to-Cash runs today. A factual baseline of the process, the systems that support it, and how information is structured — stated as fact, no judgements.

1.1 Domain overview

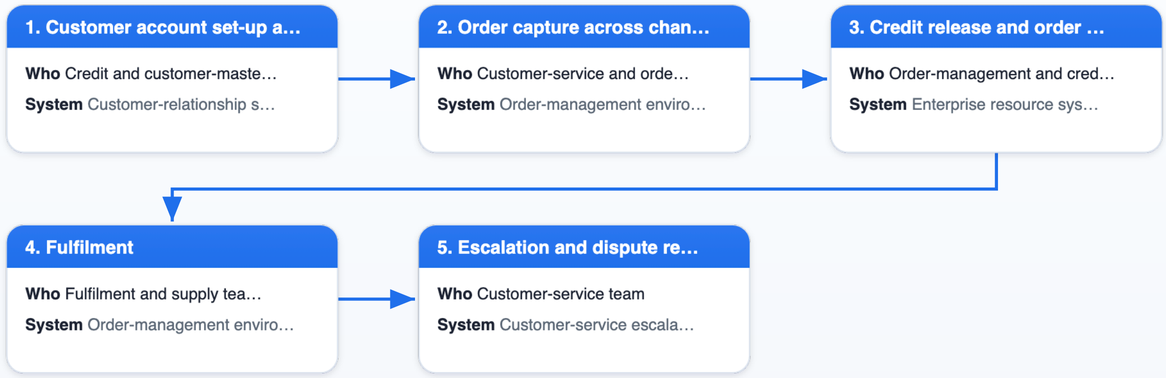
This assessment covers the order-to-cash process for the European retail business of a consumer-healthcare organisation — from how customer credit is set and maintained, through how orders arrive and are processed across channels, to how unfulfilled orders and service failures are escalated and resolved. The process spans two customer systems, a portfolio of large retail accounts, and a high-volume electronic ordering channel that together carry the majority of the organisation's order value.

Customer accounts are established and maintained across two systems — a customer-relationship system and an enterprise resource system — each of which holds its own view of credit limits and payment terms. Orders reach the organisation through several channels, the largest by far being electronic data interchange (the automated retailer-to-supplier ordering channel), alongside manual entry and email. Orders are released against credit limits, fulfilled, and where they fail, raised through a customer-service escalation route. Credit governance is defined in a single policy, order handling in an order-management procedure and an accountability matrix, while the electronic ordering channel is handled largely through informal working notes.

1.2 Process flow

The end-to-end flow, who performs each step and on which system:

HOW WORK MOVES, END TO END



Step	Performed by	System	What happens
1. Customer account set-up and credit assignment	Credit and customer-master teams	Customer-relationship system and enterprise resource system	New retail customers are onboarded and assigned a credit limit and payment terms. Account records are created and maintained in both the customer-relationship system and the enterprise resource system. The credit policy designates the enterprise resource system as the sole system of record for credit limits.
2. Order capture across channels	Customer-service and order-management teams	Order-management environment and the electronic ordering channel	Orders are received through electronic data interchange, manual entry and email. The electronic channel accounts for the majority of order volume and value. Manual and email orders are keyed or handled by customer-service staff.
3. Credit release and order processing	Order-management and credit teams	Enterprise resource system and customer-relationship system	Orders are checked against the customer credit limit and released for fulfilment. Releases draw on the credit limit visible in the systems used at the point of decision.
4. Fulfilment	Fulfilment and supply teams	Order-management environment	Released orders proceed to fulfilment. A portion of orders, concentrated in the electronic channel, are recorded as not fulfilled.
5. Escalation and dispute resolution	Customer-service team	Customer-service escalation route	Order failures and disputes are raised through the customer-service escalation route. Electronic-channel issues requiring manual re-entry are among the most frequent escalation reasons and are handled through informal working notes.

1.3 Systems & sources

Each system that supports this process — what it is, how it is used, who owns it, and the constraints observed.

Enterprise resource system

The core transactional backbone for customer master data, credit limits, payment terms and order fulfilment records.

How it's used. Used day to day to hold authoritative customer records and to fulfil orders. The credit policy names it as the sole system of record for credit limits.

Ownership & access. Owned by the credit and customer-master functions, with access across credit, finance and order-management teams.

Observed constraints. Its credit limits differ from those held in the customer-relationship system for the majority of matched accounts.

Customer-relationship system

The customer-facing account view, holding credit limits and payment terms alongside relationship data.

How it's used. Used by sales and customer-facing teams; its credit values are visible at points where order decisions are made.

Ownership & access. Owned by the commercial/sales function, with broad customer-facing access.

Observed constraints. Holds credit limits and payment terms that diverge from the designated system of record for most matched accounts.

Electronic ordering channel

The automated retailer-to-supplier ordering channel through which most order volume and value arrive.

How it's used. Receives orders automatically from large retail customers; failed orders are re-entered manually by customer service.

Ownership & access. No documented owner in the order-management procedure or accountability matrix; handled informally by customer service.

Observed constraints. Not covered by the order-management procedure or the accountability matrix; order failures in this channel are recorded at a higher rate than in manual entry.

Customer-service escalation route

The channel for raising and resolving order failures and disputes.

How it's used. Customer service logs escalations and resolves electronic-channel issues using informal working notes.

Ownership & access. Owned by customer-service management for logged escalations; electronic-channel resolution has no documented owner.

Observed constraints. Resolution of electronic-channel issues relies on informal working notes rather than a documented procedure.

1.4 Information format & structure

The patterns the source information follows — this drives how it can be ingested and reasoned over.

Pattern	Description	Where it appears
Type 1 — Structured transactional and master-data exports	System extracts of customer records, credit limits, payment terms and order outcomes, organised account-by-account and order-by-order.	the enterprise resource customer records, the customer-relationship records, the order flow analysis
Type 2 — Governing policies and procedures	Formal documents that define how credit is set and how orders should be handled, including the designated system of record.	the credit management policy, the order management procedure, the retail customer onboarding guide, the parent-company order-to-cash procedure
Type 3 — Accountability and integration registers	Documents that map who owns which activity and which electronic connections exist.	the order-to-cash accountability matrix, the electronic ordering register
Type 4 — Operational logs and informal working notes	Running records of escalations, disputes and the informal resolution steps applied to electronic-channel failures.	the customer service escalation log, the dispute resolution working notes, the accounts receivable review notes

1.5 Process inventory

- **Customer onboarding and credit assignment** — Establish retail customer accounts and set credit limits and payment terms across both customer systems.
- **Multi-channel order capture** — Receive and record orders through electronic data interchange, manual entry and email.
- **Credit release** — Check orders against customer credit limits and release them for fulfilment.
- **Order fulfilment** — Progress released orders through to delivery.
- **Escalation and dispute resolution** — Capture and resolve order failures, including electronic-channel re-entry.

1.6 Ownership map

Activity	Responsible	Accountable
Credit limit and payment-term assignment	Credit and customer-master teams	Credit management function
Manual and email order processing	Customer-service team	Customer-service management
Electronic data interchange order processing	Not assigned	Not assigned
Electronic-channel dispute and re-entry resolution	Customer-service team (via informal working notes)	Not assigned

1.7 System inventory

System	Role	System of record for
Enterprise resource system	Core transactional system holding customer master data, credit limits, payment terms and order fulfilment records.	Credit limits, per the credit management policy
Customer-relationship system	Customer-facing system holding an account view including credit limits and payment terms.	Not designated as system of record for credit
Electronic ordering channel (electronic data interchange)	Automated retailer-to-supplier ordering channel carrying the majority of order volume and value.	Inbound order capture for the largest retail accounts
Customer-service escalation route	Channel through which order failures and disputes are raised and tracked.	Service escalations and dispute records

1.8 Handoff catalogue

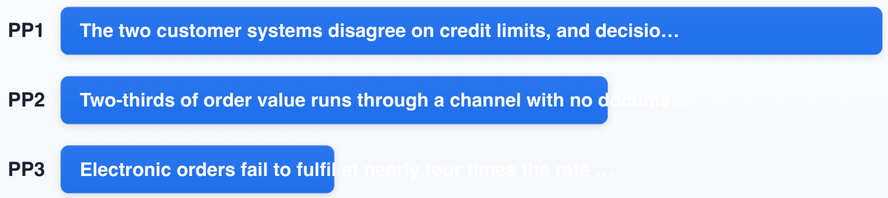
- Customer account set-up and credit assignment → Credit release and order processing *(Credit limits and payment terms held in the two customer systems)*

- Order capture across channels → Credit release and order processing *(Captured orders passed for credit check and release)*
- Credit release and order processing → Fulfilment *(Released orders passed to fulfilment)*
- Fulfilment → Escalation and dispute resolution *(Unfulfilled orders surfaced to customer service)*
- Escalation and dispute resolution → Order capture across channels *(Manual re-entry of failed electronic orders)*

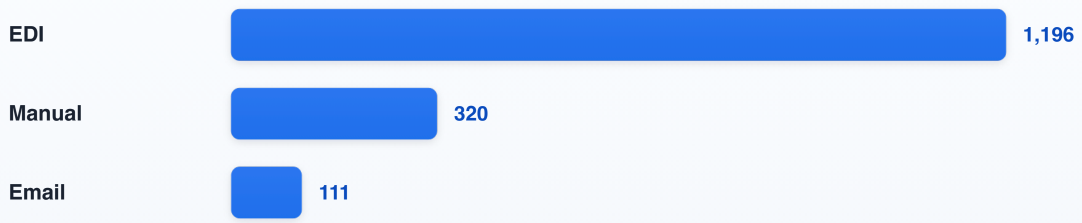
Pain Points & Opportunities

The issues found in the discovery, ranked by business impact, each mapped to a recommended opportunity.

ISSUES RANKED BY BUSINESS IMPACT (MOST MATERIAL FIRST)



UNFULFILLED ORDERS BY CHANNEL



The two customer systems disagree on credit limits, and decisions are being made against the non-authoritative view

For 267 of 318 matched customers, the customer-relationship system and the enterprise resource system hold different credit limits, with aggregate divergence reaching a large multi-million-euro total. On the largest accounts the difference on a single account is substantial. Payment terms also differ for 228 accounts. Because order release decisions can draw on whichever system is visible at the point of decision, credit can be extended beyond the limit held in the designated system of record without an approval trail.

267 of 318 matched accounts hold different credit limits across the two systems

€30.7M — aggregate credit-limit divergence against the system of record

600,000 — largest divergence observed on a single large retail account

228 accounts also hold different payment terms across the two systems

Root cause: Two systems each hold their own credit values with no single enforced source feeding order release, despite the policy naming the enterprise resource system as the sole system of record.

Pattern: Silent data divergence between two systems of truth, surfaced only in periodic reviews rather than at the point of decision.

Addressed by: OPP1 (see the Opportunity Portfolio)

Where this comes from: SAP S/4HANA Customer Master Export, SAP CRM Customer Export, Credit Management Policy Europe and Accounts Receivable Review Notes Q4 2025

Two-thirds of order value runs through a channel with no documented owner

The electronic ordering channel carries 67.3% of orders by count and a value of €59.7M, yet it is explicitly excluded from both the order-management procedure and the accountability matrix. The most frequent service failure tied to this channel — electronic orders requiring manual re-entry — has no documented owner and is resolved through informal working notes. This single root cause accounts for 23.9% of all escalations, with 34 escalations logged.

67.3% of orders by count arrive through the electronic channel
€59.7M — order value running through the electronic channel
34 escalations logged for electronic orders requiring manual intervention
this single root cause accounts for 23.9% of all escalations

Root cause: The largest order channel was never brought into the formal procedure or accountability framework, leaving ownership informal.

Pattern: An unowned high-volume channel where resolution depends on individual knowledge rather than a defined procedure.

Addressed by: OPP3 (see the Opportunity Portfolio)

Where this comes from: Order Flow Analysis Export 2025, Order Management SOP Europe, O2C Process RACI Europe and Customer Service Escalation Log 2025

Electronic orders fail to fulfil at nearly four times the rate of manual orders

1,196 electronic-channel orders worth €12.4M are recorded as not fulfilled — the largest single failure bucket and nearly four times the unfulfilled rate of manual orders (320 unfulfilled) and email orders (111 unfulfilled). Combined with the absence of a procedure and ownership for the channel, this drives repeated stockout and 'order not received' escalations and explicit customer delisting threats, putting both revenue and key retail relationships at risk.

1,196 electronic-channel orders recorded as not fulfilled
€12.4M — value of electronic orders recorded as not fulfilled
320 manual orders unfulfilled by comparison
111 email orders unfulfilled by comparison

Root cause: Failures in the electronic channel are caught late and resolved manually, with no upstream control to prevent orders from dropping out before fulfilment.

Pattern: Concentrated fulfilment failure in the highest-volume channel, surfacing as customer-facing service incidents rather than being prevented at source.

Addressed by: OPP2 (see the Opportunity Portfolio)

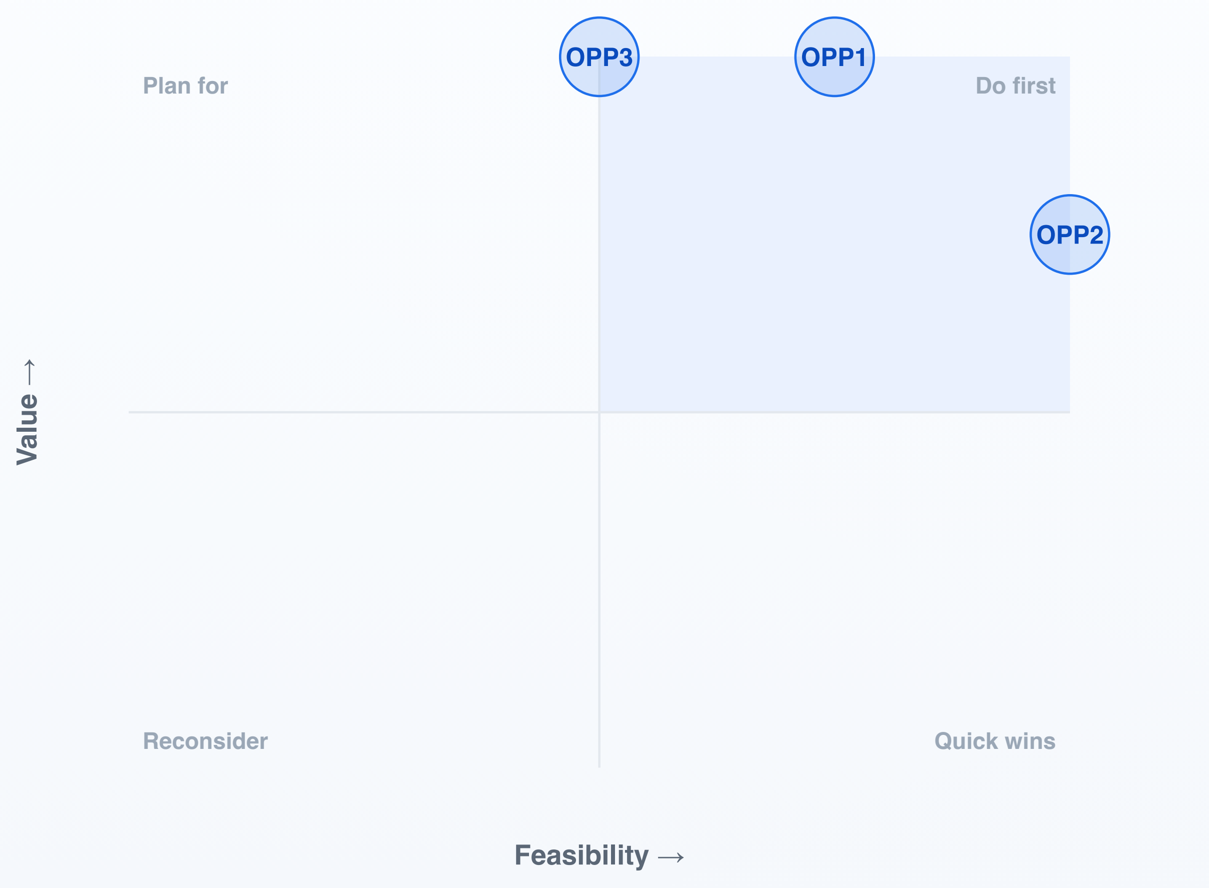
Where this comes from: Order Flow Analysis Export 2025, Customer Service Escalation Log 2025 and EDI Dispute Resolution CS Working Notes

Transformation Recommendation

Which opportunities to pursue, in what order, by value and feasibility.

Value vs. feasibility

WHERE EACH OPPORTUNITY SITS ON VALUE VERSUS FEASIBILITY



DO FIRST

Single trusted credit view with controlled approval at the point of release

Formal ownership and procedure for the electronic ordering channel

PLAN FOR

Early detection and prevention of electronic-order fulfilment failures

CONSIDER

—

DEPRIORITISE

—

Opportunity ratings

Opportunity	Pattern	Value	Feasibility	Sequence
Single trusted credit view with controlled approval at the point of release	HITL Workflow	High	High	Can start now
Formal ownership and procedure for the electronic ordering channel	Modernisation	High	High	Can start now
Early detection and prevention of electronic-order fulfilment failures	Automation Pipeline	High	Medium	Requires Customer Master Reconciliation first

Prioritization rationale

Each opportunity assessed across three readiness dimensions. The rating (high / medium / low) is followed by the reason, so the sequence is defensible rather than asserted.

Opportunity	Data readiness	Technical complexity	Operational readiness
Single trusted credit view with controlled approval at the point of release	HIGH credit limits and payment terms already exist as structured fields in both systems	MEDIUM requires a reliable continuous comparison and a release-time approval step across two systems	MEDIUM credit approvers exist but the controlled approval step is a new behaviour to embed
Formal ownership and procedure for the electronic ordering channel	HIGH the channel volume, value and failure modes are already documented	LOW this is procedural and accountability change rather than a system build	MEDIUM requires leadership to assign ownership and embed the new procedure
Early detection and prevention of electronic-order fulfilment failures	HIGH order outcomes and failure patterns already exist as structured records	MEDIUM requires monitoring logic and reliable detection of at-risk orders	MEDIUM depends on a named channel owner being in place to act on flags

Sequencing rationale

The two foundational interventions — bringing the credit view under control and assigning ownership of the electronic channel — carry no prerequisites and can begin immediately; both address the highest-impact findings and require mainly governance and reconciliation work. The early-detection capability for electronic-order failures depends on a named channel owner being in place to act on what it surfaces, so it follows the ownership intervention rather than running ahead of it. Sequencing therefore establishes control and accountability first, then layers prevention on top.

Dependencies: OPP3 depends on OPP2 because automated early detection of electronic-order failures requires a documented channel owner to receive and act on the flagged orders. OPP1 and OPP2 have no dependencies and can proceed in parallel.

Strategic readiness

The organisation already holds the underlying records as structured data — credit values, order outcomes and escalation patterns are all available — which makes the data foundation strong. The principal readiness work is organisational: enforcing a single trusted credit source at release, assigning ownership for the largest order channel, and embedding the new approval and resolution behaviours. These are achievable with existing teams and documents.

Where this should converge

Once these interventions land, credit decisions converge on a single trusted view: every release is checked against the designated system of record, and any difference is approved explicitly and recorded rather than applied silently. The electronic ordering channel — today the largest by value yet the least governed — sits firmly inside the formal procedure with a named owner accountable for both routine handling and failure recovery. Order failures in that channel are caught and resolved before they reach customers, replacing reactive escalations and delisting threats with prevention at source. The organisation operates from one controlled order-to-cash baseline, with credit divergence, unfulfilled volume and manual-intervention escalations all held below their current levels through continuous monitoring and periodic governance review.

AI Opportunity Portfolio

The recommended interventions in full — what the problem is, how the process changes, and what it delivers.

At a glance

Opportunity	Pattern	Who it serves	Knowledge sources	Expected behaviour
Single trusted credit view with controlled approval at the point of release	HITL Workflow	Credit approver, Credit and customer-master analyst, Order-management lead	the enterprise resource credit master, the customer-relationship credit view, the credit management policy	Day to day it compares the two credit views and lets matching orders flow through; it never raises a customer…
Formal ownership and procedure for the electronic ordering channel	Modernisation	Electronic channel owner, Customer-service lead, Order-management lead	the order management procedure, the order-to-cash accountability matrix, the dispute resolution working notes, the electronic ordering register	Day to day it provides a documented owner and standard steps for handling electronic orders and their failure…
Early detection and prevention of electronic-order fulfilment failures	Automation Pipeline	Electronic channel owner, Customer-service team, Order-management lead	the order flow records, the dispute resolution working notes, the customer service escalation log	Day to day it watches the electronic order flow and flags orders at risk of failing; it surfaces them for act…

In detail

Single trusted credit view with controlled approval at the point of release

HITL WORKFLOW

Establish the enterprise resource system as the enforced single source for credit limits and payment terms at the point of order release, and reconcile the customer-relationship view to it. Where the two views diverge, route the difference to a credit approver for an explicit, recorded decision before release rather than allowing the higher figure to be used silently.

> **Before**
>
> **1. Credit values held separately**
>
> Credit and customer-master teams · Both customer systems
>
> Credit limits and payment terms are maintained independently in both systems with no enforced reconciliation.
>
> **2. Release against visible limit**
>
> Order-management team · Order-management environment
>
> Orders are released against whichever credit limit is visible at the point of decision, which may exceed the system of record.

> **After**
>
> **1. Reconcile and surface differences**
>
> Credit team supported by an automated comparison · Reconciliation workflow
>
> The two credit views are continuously compared and any divergence is surfaced for review against the system of record.
>
> **2. Approve before release**
>
> Credit approver · Credit release workflow
>
> Where a release would exceed the system-of-record limit, the difference is routed to a credit approver for an explicit, recorded decision before the order proceeds.

Business impact. Brings the aggregate credit-limit divergence under control and ensures the 267 mismatched accounts are decided against the designated system of record with a recorded approval trail. Removes silent over-extension on the largest accounts, where the single-account difference is substantial.

267 mismatched accounts brought onto a single trusted credit view

€30.7M — aggregate credit-limit divergence addressed

600,000 — largest single-account divergence removed from silent use

How we get there: Impact framed directly against the verified divergence figures; no new numbers introduced.

How it's delivered. Designate and enforce the enterprise resource system as the operative credit source at release; build a continuous comparison of the two views; introduce a controlled approval step for any release exceeding the system-of-record limit; align payment terms in the same reconciliation.

Who uses it. Credit approver, Credit and customer-master analyst, Order-management lead

Expected behaviour. Day to day it compares the two credit views and lets matching orders flow through; it never raises a customer's effective credit limit on its own and never releases an over-limit order without a recorded human approval.

Escalation & human fallback. When a release would exceed the system-of-record limit, it pauses the order and hands it to a credit approver with the difference shown, for an explicit decision.

Sources. the enterprise resource credit master, the customer-relationship credit view, the credit management policy **Formats.** structured customer master exports, the credit policy document

Dependencies: Independent — can start immediately.

Where this comes from: SAP S/4HANA Customer Master Export, SAP CRM Customer Export, Credit Management Policy Europe and Accounts Receivable Review Notes Q4 2025

Formal ownership and procedure for the electronic ordering channel

MODERNISATION

Bring the electronic ordering channel into the formal order-management procedure and the accountability matrix, assigning a documented owner for the channel and for the manual re-entry failure mode, replacing reliance on informal working notes.

Before

1. Channel runs outside the procedure

Customer-service team (informally) · Electronic ordering channel

The electronic channel carrying the majority of order value is excluded from the procedure and the accountability matrix.

2. Failures resolved informally

Customer-service team · Customer-service escalation route

Manual re-entry of failed electronic orders is resolved using informal working notes with no documented owner.

After

1. Channel brought into the procedure

Order-management and customer-service leadership · Order-management environment

The electronic channel is documented in the procedure and the accountability matrix, with a named owner for the channel and the re-entry failure mode.

2. Standardised resolution

Channel owner · Customer-service escalation route

Manual re-entry follows a documented procedure under the named owner, replacing reliance on informal notes.

Business impact. Establishes documented accountability for the channel carrying 67.3% of orders and a value of €59.7M, and gives the 34 manual-intervention escalations — 23.9% of all escalations — a named owner and a repeatable resolution path instead of informal notes.

€59.7M — order value brought under documented ownership

67.3% of orders by count formally owned

34 manual-intervention escalations given a named owner

23.9% of all escalations addressed through documented ownership

How we get there: Framed against the verified channel share and escalation figures; no new numbers introduced.

How it's delivered. Update the order-management procedure and accountability matrix to include the electronic channel; assign a named owner for the channel and the re-entry failure mode; formalise the informal working notes into a documented resolution procedure; reference the electronic ordering register for connection coverage.

Who uses it. Electronic channel owner, Customer-service lead, Order-management lead

Expected behaviour. Day to day it provides a documented owner and standard steps for handling electronic orders and their failures; it does not itself process orders but defines who does and how.

Escalation & human fallback. Where the documented procedure does not cover a situation, it routes to the named channel owner for a decision and a procedure update.

Sources. the order management procedure, the order-to-cash accountability matrix, the dispute resolution working notes, the electronic ordering register
Formats. procedure and accountability documents, the electronic ordering register, operational working notes

Dependencies: Independent — can start immediately. Prerequisite for the AI Credit Decisioning step.

Where this comes from: Order Flow Analysis Export 2025, Order Management SOP Europe, O2C Process RACI Europe, EDI Dispute Resolution CS Working Notes and Customer Service Escalation Log 2025

Early detection and prevention of electronic-order fulfilment failures

AUTOMATION PIPELINE

Introduce automated monitoring of the electronic channel that detects orders at risk of dropping out before fulfilment and surfaces them for action, reducing the volume of orders that reach the unfulfilled state and the downstream escalations and delisting threats they cause.

> **Before**
>
> **1. Failures caught late**
>
> Customer-service team · Order-management environment
>
> Electronic orders drop out and are only noticed once recorded as unfulfilled, often via customer escalations.
>
> **2. Manual recovery**
>
> Customer-service team · Customer-service escalation route
>
> Failed orders are recovered manually and surface as stockout and 'order not received' escalations, including delisting threats.

> **After**
>
> **1. Detect at risk early**
>
> Automated monitoring · Monitoring workflow
>
> The electronic order flow is monitored and orders at risk of dropping out are surfaced before they reach the unfulfilled state.
>
> **2. Prompt resolution under ownership**
>
> Channel owner and customer-service team · Order-management environment
>
> At-risk orders are resolved promptly by the documented channel owner before they become customer-facing failures.

Business impact. Targets the 1,196 unfulfilled electronic orders worth €12.4M — the largest failure bucket and far above the 320 unfulfilled manual and 111 unfulfilled email orders — by catching failures before they reach customers and reducing the stockout and delisting escalations they generate.

1,196 unfulfilled electronic orders targeted for prevention

€12.4M — value of unfulfilled electronic orders at stake

compared with 320 unfulfilled manual orders

compared with 111 unfulfilled email orders

How we get there: Framed against the verified unfulfilled-order figures; no new numbers introduced.

How it's delivered. Build automated monitoring of the electronic order flow that identifies orders at risk of dropping out; route at-risk orders to the channel owner for prompt action; track recovery against the unfulfilled baseline.

Who uses it. Electronic channel owner, Customer-service team, Order-management lead

Expected behaviour. Day to day it watches the electronic order flow and flags orders at risk of failing; it surfaces them for action and never cancels or alters a customer order on its own.

Escalation & human fallback. When an at-risk order cannot be resolved automatically, it hands the order to the channel owner with the detected issue for manual recovery.

Sources. the order flow records, the dispute resolution working notes, the customer service escalation log **Formats.** structured order flow exports, operational working notes, the escalation log

Dependencies: Requires Customer Master Reconciliation first.

Where this comes from: Order Flow Analysis Export 2025, Customer Service Escalation Log 2025 and EDI Dispute Resolution CS Working Notes

Transformation Roadmap

Sequenced across three horizons, aimed at a **Establish a single trusted operating baseline for credit and order fulfilment, then prevent failures at source** direction.

H1 — Establish control and accountability over credit and the largest order channel (0-6 months)

- **Single trusted credit view with controlled approval at release** opportunity — Highest-impact finding; brings the credit divergence across 267 accounts under control with no prerequisite, using data that already exists as structured fields.
- **Formal ownership and procedure for the electronic ordering channel** opportunity — Assigns documented ownership for the channel carrying 67.3% of orders; mainly procedural, no prerequisite, and a foundation for prevention work.

H2 — Prevent electronic-order failures before they reach customers (6-18 months)

- **Early detection and prevention of electronic-order fulfilment failures** opportunity — Targets the 1,196 unfulfilled electronic orders; sequenced after ownership is in place so flagged orders have a documented owner to act on them.

H3 — Sustain and extend the controlled order-to-cash baseline (18+ months)

- **Embed continuous monitoring and periodic governance review across credit and channel performance** — Once control, ownership and prevention are live, sustain them through ongoing review so divergence, unfulfilled volume and escalation rates stay below their established baselines.

Success metrics framework

How the impact of the recommended interventions should be measured once live — the dimension, what it means, and the target to hold delivery to.

Metric	Definition	Target
Credit-view alignment	The proportion of matched customer accounts where the two systems hold the same credit limit, measured against the baseline of 267 mismatched accounts.	Near-complete alignment, a material reduction against the 267 mismatched-account baseline.
Controlled credit divergence	Aggregate credit-limit divergence between the two systems against the designated system of record.	A material reduction against the verified aggregate-divergence baseline, trending toward elimination.
Electronic-channel ownership coverage	Whether the electronic channel — 67.3% of orders — is covered by a documented owner in the procedure and accountability matrix.	Full documented ownership of the channel and its re-entry failure mode.
Unfulfilled electronic orders	The count and value of electronic orders recorded as not fulfilled, against the baseline of 1,196 orders.	A material reduction against the 1,196-order baseline, improving through tuning.
Manual-intervention escalations	Escalations raised for electronic orders requiring manual re-entry, against the baseline of 34 escalations representing 23.9% of all escalations.	A material reduction against the 34-escalation baseline and its 23.9% share.

System & data-flow map
