Executive Summary

Order-to-Cash runs on two customer systems that disagree on credit, and a dominant electronic channel that no procedure owns — together putting material order value and revenue at risk.

1 At a glance

€12.4M value not fulfilled	67% EDI share of orders	5 issues identified	5 opportunities mapped

1.1 Situation & opportunity

The situation

Orders arrive mainly through EDI, which carries two-thirds of volume yet sits outside the documented process and has no owner. Credit checks run against two systems whose limits diverge for 267 of 318 shared accounts.

The opportunity

Reconcile the customer master to a single agreed source of truth, bring the electronic channel under documented ownership with automated exception handling, then add a real-time credit gate to the channel that needs it most.

2 Where to start

WHERE EACH OPPORTUNITY SITS ON VALUE VERSUS FEASIBILITY

CLASSIFICATION	Confidential

Contents

Current State Assessment

How Order-to-Cash runs today. A factual baseline of the process, the systems that support it, and how information is structured — stated as fact, no judgements.

1 Domain overview

1.1 Context and scope

Order-to-Cash covers how customer orders are received, credit-checked, fulfilled, invoiced and collected. Orders arrive through several channels, with electronic data interchange (EDI) carrying the largest share.

Orders enter through EDI, manual entry, email and fax. Customer and credit information is held in two systems — SAP S/4HANA and SAP CRM. Orders are checked against a credit limit, released to the warehouse for fulfilment, then invoiced and collected by the accounts receivable team.

1.2 Volume baseline

8,420
Total orders processed — calendar year 2025

67.3%
Orders received via EDI — 5,667 of 8,420

14
Active EDI connections — 8 owned + 6 under TSA

340
Active customer accounts — in the ERP master

Order channel mix — 2025

Volumes and shares are counted directly from the order-flow export.

CHANNEL	ORDERS	SHARE	ENTRY METHOD	NOT FULFILLED
EDI	5,667	67.3%	Automated into order management	1,196
Telephone / manual	1,802	21.4%	Keyed into the ERP by an agent	320
Email	767	9.1%	Keyed in within one business day	111
Fax	184	2.2%	Keyed in; by exception agreement only	40
Total	8,420	100%	—	1,667

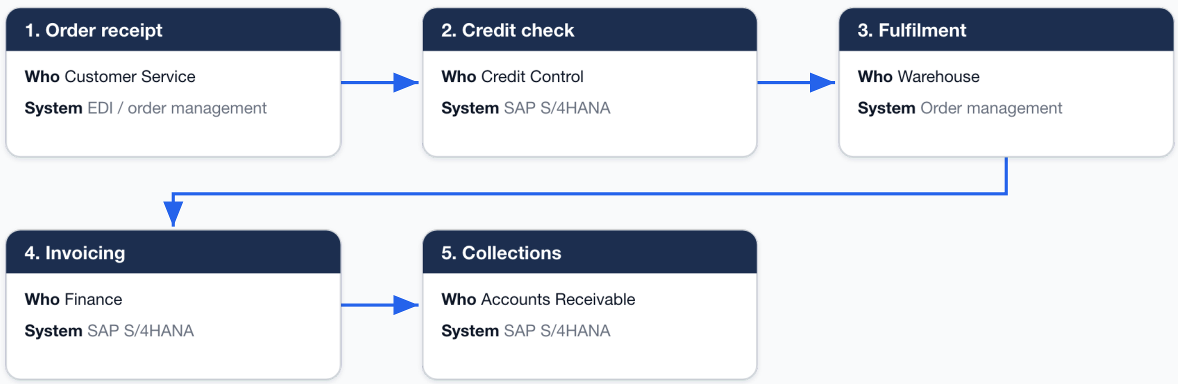
Fax appears in the order data although the Order Management SOP lists only telephone and email as standard channels.

Source: Order Flow Analysis Export 2025

2 Process flow

The end-to-end flow, who performs each step and on which system:

HOW WORK MOVES, END TO END



STEP	PERFORMED BY	SYSTEM	WHAT HAPPENS
1. Order receipt	Customer Service	EDI / order management	Orders arrive by EDI, manual entry, email or fax and are recorded for processing.
2. Credit check	Credit Control	SAP S/4HANA	Each order is checked against the customer's credit limit before it is released.
3. Fulfilment	Warehouse	Order management	Released orders are picked, packed and dispatched.
4. Invoicing	Finance	SAP S/4HANA	Dispatched orders are invoiced to the customer.
5. Collections	Accounts Receivable	SAP S/4HANA	Outstanding invoices are tracked and collected.

3 Process inventory

Each stage of the process in detail — how it runs today, who performs it, and on which system.

Order receipt

Customer Service · EDI / ERP

EDI orders flow automatically into order management across 14 connections (8 on the organisation's own platform, 6 still operated by the former parent). Telephone orders are keyed into the ERP within 30 minutes of the call; email orders within one business day, against per-market cut-off times.

Source: Order Management SOP Europe and EDI Integration Register Europe

Order validation

Customer Service · SAP S/4HANA

A mandatory sequence runs in the ERP: customer account status, credit-limit verification against the outstanding balance, product availability at the allocated distribution centre, minimum-order-quantity compliance, and pricing validation (a variance under 2% is processed at the system price; 2% or more is referred to the account manager).

Source: Order Management SOP Europe

Credit assessment

Credit Control · SAP S/4HANA

The ERP places an order on credit hold automatically where it would take the account past its approved limit, or where an invoice is more than 60 days overdue. The agent notifies the Credit Controller within four business hours; release authority follows the approval-authority bands.

Source: Credit Management Policy Europe and Order Management SOP Europe

Order confirmation & fulfilment

Customer Service / Distribution · ERP / order management

Confirmation issues within four business hours for telephone orders and two for email orders. Released orders are picked, packed and dispatched from the market's distribution centre against the documented standard lead times.

Source: Order Management SOP Europe

Invoicing

Finance · SAP S/4HANA

Invoices generate automatically on dispatch confirmation. Payment terms follow the account tier: major retail on NET 45 with a 1% early-payment discount, pharmacy and wholesale on NET 30, and new accounts on NET 14 or cash with order for the first six months.

Source: Order Management SOP Europe and Credit Management Policy Europe

Accounts receivable & collections

Accounts Receivable · SAP S/4HANA

Aged-debtor reporting runs monthly; balances over 60 days are reviewed individually. Collections follow the overdue escalation ladder, and the team completes a quarterly self-assessment of compliance.

Source: Credit Management Policy Europe

Standard fulfilment lead times by market

Documented standard lead times and the distribution centre serving each market.

MARKET	LEAD TIME	PRIMARY DISTRIBUTION CENTRE
France	2 business days	Chartres, FR
United Kingdom	3 business days	Swindon, UK
Germany	2 business days	Frankfurt, DE
Austria / Switzerland	3 business days	Frankfurt, DE
Spain	3 business days	Barcelona, ES
Portugal	4 business days	Barcelona, ES
Benelux	2 business days	Antwerp, BE
Italy	3 business days	Milan, IT (third-party operated)

Credit limit approval authority

Approval authority for setting and changing credit limits, by band.

CREDIT LIMIT BAND	NEW ACCOUNT	LIMIT INCREASE
Up to €250,000	Credit Controller	Credit Controller
€250,001 – €500,000	Finance Director	Finance Director
€500,001 – €1,000,000	Finance Director + VP Commercial	Finance Director
Above €1,000,000	Finance Director + VP Commercial + CEO	Finance Director + VP Commercial

Source: Credit Management Policy Europe

Collections escalation ladder

The documented overdue-collections escalation ladder.

OVERDUE	ACTION	OWNER
1–30 days	Automated payment reminder on day 5	System
31–60 days	Formal payment demand; account flagged	Credit Controller
61–90 days	Second demand; credit-hold proposed	Credit Controller
91+ days	Account on hold; new orders suspended; agency referral considered	Finance Director

5.3 System profiles

Each system that supports this process — what it is, how it is used, who owns it, and the constraints observed.

SAP S/4HANA

The core ERP and the system of record for orders, credit limits, invoicing and collections.

How it's used. Customer Service, Credit Control, Finance and Accounts Receivable all work in S/4HANA: orders are recorded here, the credit check reads the credit limit held against the account, and invoices and open receivables are tracked here through to collection.

Ownership & access. Owned by Finance Systems; used daily by Customer Service, Credit Control and Accounts Receivable.

Observed constraints. Holds its own credit limit per account. For 267 shared accounts that value differs from the one held in CRM, and the credit check reads whichever record the system resolves first.

SAP CRM

The customer-relationship system, holding account and commercial relationship data for the same retail customers.

How it's used. Used by the commercial team to manage account relationships; it also holds credit limits and payment terms that were updated by hand over time.

Ownership & access. Owned by the commercial function; no shared governance with Finance Systems over the credit fields.

Observed constraints. CRM credit limits were edited manually without an approval trail. Its values differ from the ERP — Carrefour France shows €2.4M in CRM against €1.8M in the ERP, a €600,000 difference on a single account.

EDI / order-management channel

The electronic data interchange channel through which the largest share of customer orders arrives.

How it's used. Carries 67% of order volume (5,667 of 8,420 orders). Orders flow straight into order management for fulfilment; exceptions are picked up by hand by Customer Service.

Ownership & access. No named owner — the Order-to-Cash RACI leaves EDI order processing and EDI dispute resolution as 'Not assigned'.

Observed constraints. Not covered by the Order Management SOP, and no credit check runs on it before release. 1,196 EDI orders (€12.4M) sit unfulfilled, and 'EDI order not processed' appears 34 times in the escalation log.

5.4 Information format & structure

The patterns the source information follows — this drives how it can be ingested and reasoned over.

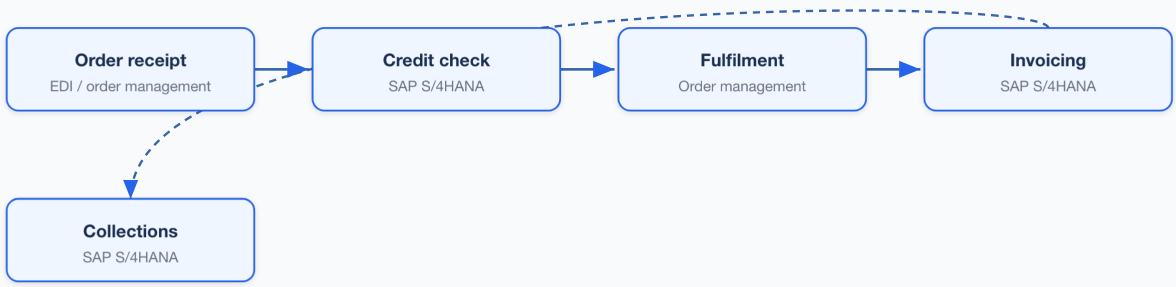
PATTERN	DESCRIPTION	WHERE IT APPEARS
Type 1 — Structured transactional export	Row-per-transaction tabular data with typed columns (amounts, dates, account IDs, channel). Machine-readable and directly aggregatable.	Order-flow export, customer-master extracts from the ERP and CRM, accounts-receivable ledger.
Type 2 — Governance & policy document	Prose documents that state the intended (to-be) rules: who approves what, which system is authoritative, and the documented procedure.	Order Management SOP, Credit Policy, the Order-to-Cash process RACI.

PATTERN	DESCRIPTION	WHERE IT APPEARS
Type 3 — Operational log & working notes	Semi-structured incident and escalation records plus free-text agent notes — the lived reality of how exceptions are actually handled.	Customer-service escalation log, EDI dispute-resolution working notes.

6 Handoff map

How work crosses between steps and systems — each handoff is where information changes hands or format.

WHERE WORK CROSSES BETWEEN STEPS AND SYSTEMS



Boxes are process steps; arrows are the handoffs recorded between them.

- Order receipt → Credit check *(Order record)*
- Credit check → Fulfilment *(Released order)*
- Fulfilment → Invoicing *(Dispatch confirmation)*
- Invoicing → Collections *(Open invoice)*

7 Appendix — account baseline

Top trading accounts — credit baseline

The eight accounts that trade across all channels, with their ERP credit baseline.

ACCOUNT	COUNTRY	ERP CREDIT LIMIT	PAYMENT TERMS	STATUS
Carrefour France	FR	€1,800,000	NET45	Active
Boots UK	UK	€1,200,000	NET45	Active
E.Leclerc	FR	€1,100,000	NET45	Active
Tesco UK	UK	€1,000,000	NET45	Active

ACCOUNT	COUNTRY	ERP CREDIT LIMIT	PAYMENT TERMS	STATUS
dm (Drogerie Markt)	DE	€950,000	NET45	Active
Lidl Europe	EU	€850,000	NET45	Active
Coop Group	EU	€800,000	NET45	Active
Mercadona	ES	€750,000	NET45	Active

Pain Points & Opportunities

The issues found in the discovery, ranked by business impact, each mapped to a recommended opportunity.

1 Issues at a glance

5 pain points

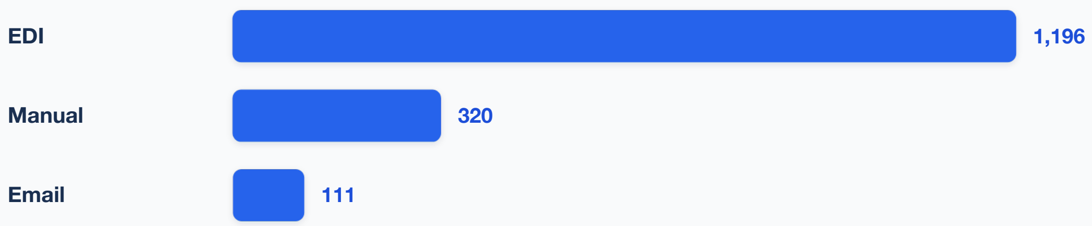
3 high severity

2 medium severity

5 opportunities

ISSUES RANKED BY BUSINESS IMPACT (MOST MATERIAL FIRST)

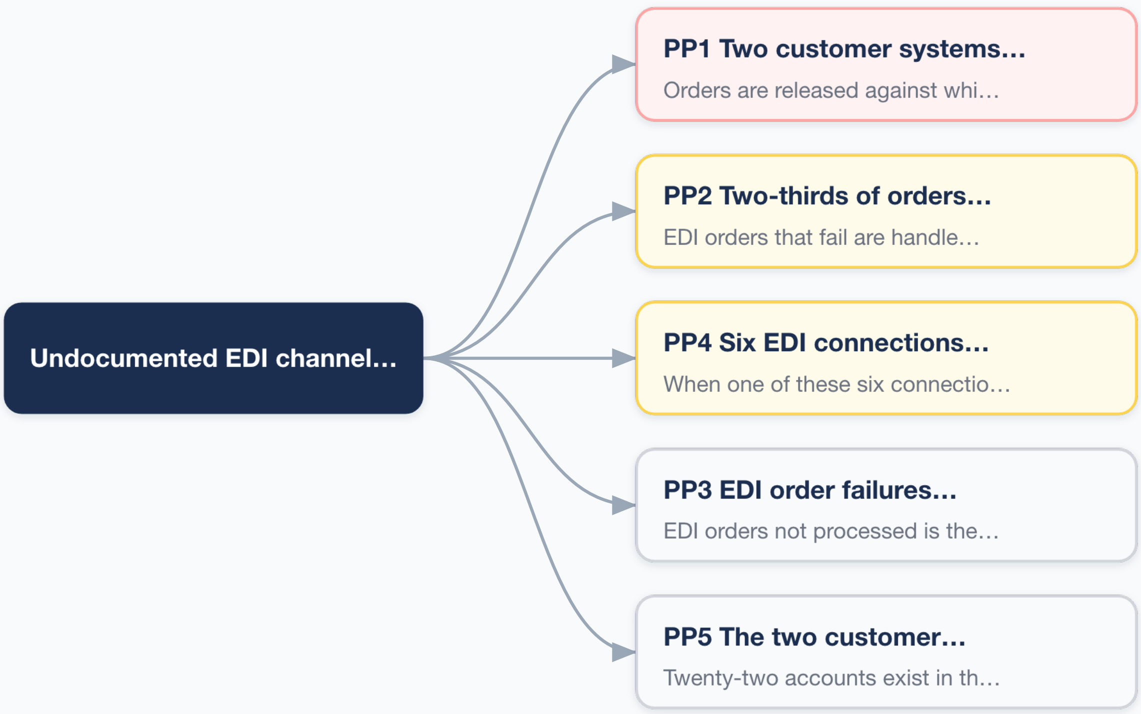
UNFULFILLED ORDERS BY CHANNEL



2 Root cause

How the issues found trace back to shared structural causes:

HOW THE ISSUES TRACE BACK TO SHARED CAUSES



Left: structural causes. Right: the pain points each one drives.

Undocumented EDI channel drives both volume and failure. The same channel that carries two-thirds of orders is also where fulfilment failures and escalations concentrate — the lack of a governed process links the two.

3 Pain points in detail

PP 01 Two customer systems disagree on credit limits

HIGH SEVERITY DATA GOVERNANCE

Your ERP and CRM hold different credit limits and payment terms for the same major retail accounts, with no single agreed source of truth.

267	€600K
ACCOUNTS WITH DIFFERENT CREDIT LI…	LARGEST SINGLE GAP (CARREFOUR FRA…

Credit-limit discrepancy register — top accounts

Where the two systems disagree, account by account — limits and terms.

ACCOUNT	COUNTRY	ERP LIMIT	CRM LIMIT	ERP TERMS	CRM TERMS
Carrefour France	FR	€1,800,000	€2,400,000	NET45	NET30
Boots UK	UK	€1,200,000	€1,550,000	NET45	NET30
E.Leclerc	FR	€1,100,000	€1,400,000	NET45	NET30
Tesco UK	UK	€1,000,000	€1,350,000	NET45	NET30
dm (Drogerie Markt)	DE	€950,000	€1,150,000	NET45	NET30

Source: *SAP S/4HANA Customer Master Export* and *SAP CRM Customer Export*

Root cause: Both systems were carried over at carve-out and were never reconciled; CRM limits were updated by hand without an approval trail.

BUSINESS IMPACT

Credit can be extended beyond the policy-approved limit, and the same account can be invoiced on two different payment terms.

ADDRESSED BY

OPP1 — see the Opportunity Portfolio.

Where this comes from: *SAP S/4HANA Customer Master Export*, *SAP CRM Customer Export*, *Accounts Receivable Review Notes Q4 2025* and *Credit Management Policy Europe*

PP 02 Two-thirds of orders run on an undocumented channel

HIGH SEVERITY PROCESS COVERAGE

EDI carries most of your order volume, yet it is not covered by the Order Management SOP and has no owner in the Order-to-Cash RACI.

67%

EDI SHARE OF ORDERS

Document-level evidence

Where each governing document leaves the EDI channel.

DOCUMENT	HOW IT TREATS EDI
Order Management SOP	Lists telephone and email as the standard channels; EDI is out of scope.

DOCUMENT	HOW IT TREATS EDI
Order-to-Cash RACI	Covers manual and email steps only; no EDI rows.
EDI dispute working notes	Informal notes, explicitly 'not an official SOP'.

Source: Order Management SOP Europe, O2C Process RACI Europe and EDI Dispute Resolution CS Working Notes

Root cause: The documented process was written for manual and email orders; EDI grew to dominate without the procedure or accountability catching up.

BUSINESS IMPACT

The channel carrying most of the order value runs with no documented procedure and no accountable owner.

ADDRESSED BY

OPP3 — see the Opportunity Portfolio.

Where this comes from: Order Flow Analysis Export 2025, O2C Process RACI Europe, Order Management SOP Europe and EDI Dispute Resolution CS Working Notes

PP 03 Six EDI connections still run on the former parent's platform

MEDIUM SEVERITY | THIRD-PARTY DEPENDENCY

Six of the fourteen live EDI connections are still operated by the former parent under a transitional service arrangement, with the service terms held in a schedule that is not in the document pack.

6
CONNECTIONS STILL UNDER THE ARRAN...

Connections still under the transitional arrangement

The six connections to bring onto the organisation's own platform.

TRADING PARTNER	COUNTRY	MIGRATION TARGET
Carrefour France	FR	Q4 2025
Boots (legacy)	UK	Q1 2026
dm (Drogerie Markt)	DE	Q1 2026

TRADING PARTNER	COUNTRY	MIGRATION TARGET
E.Leclerc	FR	Q2 2026 (provisional)
Lidl Europe	EU	Q2 2026 (provisional)
Coop Group (legacy)	EU	Q3 2026 (provisional)

The governing service terms sit in a schedule not included in the document pack; the migration dates are the register's stated targets.

Source: *EDI Integration Register Europe* and *EDI Dispute Resolution CS Working Notes*

Root cause: At carve-out, eight connections moved to the organisation's own platform while six remained on the parent's; the migration is partly complete.

BUSINESS IMPACT

The organisation cannot guarantee its own response times on the connections carrying several of its largest retail accounts.

ADDRESSED BY

OPP4 — see the Opportunity Portfolio.

Where this comes from: *EDI Integration Register Europe* and *EDI Dispute Resolution CS Working Notes*

PP 04

EDI order failures concentrate on the unowned channel

HIGH SEVERITY OPERATIONAL RESILIENCE

A large block of EDI orders is not fulfilled, on the same channel that has no documented process or owner.

1,196	€12.4M	34
EDI ORDERS NOT FULFILLED	VALUE NOT FULFILLED	EDI-NOT-PROCESSED ESCALATIONS

Unfulfilled orders by channel

Unfulfilled orders cluster on the EDI channel.

CHANNEL	ORDERS NOT FULFILLED
EDI	1,196
Telephone / manual	320
Email	111

CHANNEL	ORDERS NOT FULFILLED
Fax	40

Source: *Order Flow Analysis Export 2025*

Root cause: Without a governed EDI process, failures are absorbed reactively through manual re-entry rather than prevented.

BUSINESS IMPACT

The largest single block of unfulfilled orders — and the most frequent escalation — sits on the channel nobody owns.

ADDRESSED BY

OPP2 — see the Opportunity Portfolio.

Where this comes from: *Order Flow Analysis Export 2025*, *Customer Service Escalation Log 2025* and *EDI Dispute Resolution CS Working Notes*

PP 05 The two customer masters are not aligned on which accounts exist

MEDIUM SEVERITY DATA GOVERNANCE

The ERP holds more customer accounts than the CRM, so the two systems do not even agree on which accounts exist, let alone their credit terms.

22
ACCOUNTS IN THE ERP BUT NOT THE C...

Customer-master population

The two masters hold different account populations.

SYSTEM	ACTIVE ACCOUNTS
ERP customer master	340
CRM customer records	318
In the ERP only	22

Source: *SAP S/4HANA Customer Master Export* and *SAP CRM Customer Export*

Root cause: Accounts were created in the ERP without a matching record being maintained in the CRM after carve-out.

BUSINESS IMPACT

A clean reconciliation cannot be completed until the account populations themselves are aligned.

ADDRESSED BY

OPP5 — see the Opportunity Portfolio.

Where this comes from: SAP S/4HANA Customer Master Export and SAP CRM Customer Export

4 Appendix — evidence register

Every finding traced to the source it rests on, with the confidence tier.

CLASSIFICATION	Confidential

Contents

Transformation Recommendation

Which opportunities to pursue, in what order, by value and feasibility.

1 Transformation intent

Order-to-Cash converges on one trusted customer master, with every credit limit agreed across both systems and changes governed by an approval trail. The electronic channel is owned, documented, and self-healing: routine exceptions resolve automatically and only genuine ambiguities reach a person. Every order — whatever the channel — passes a consistent credit check before release, so the volume that flows through EDI is no longer a blind spot.

1.1 Guiding principles

P1

Strategic direction

Consolidate modernize

P2

Sequencing

Customer Master Reconciliation (OPP1) comes first because AI Credit Decisioning (OPP3) needs a clean, single credit limit per account to work.

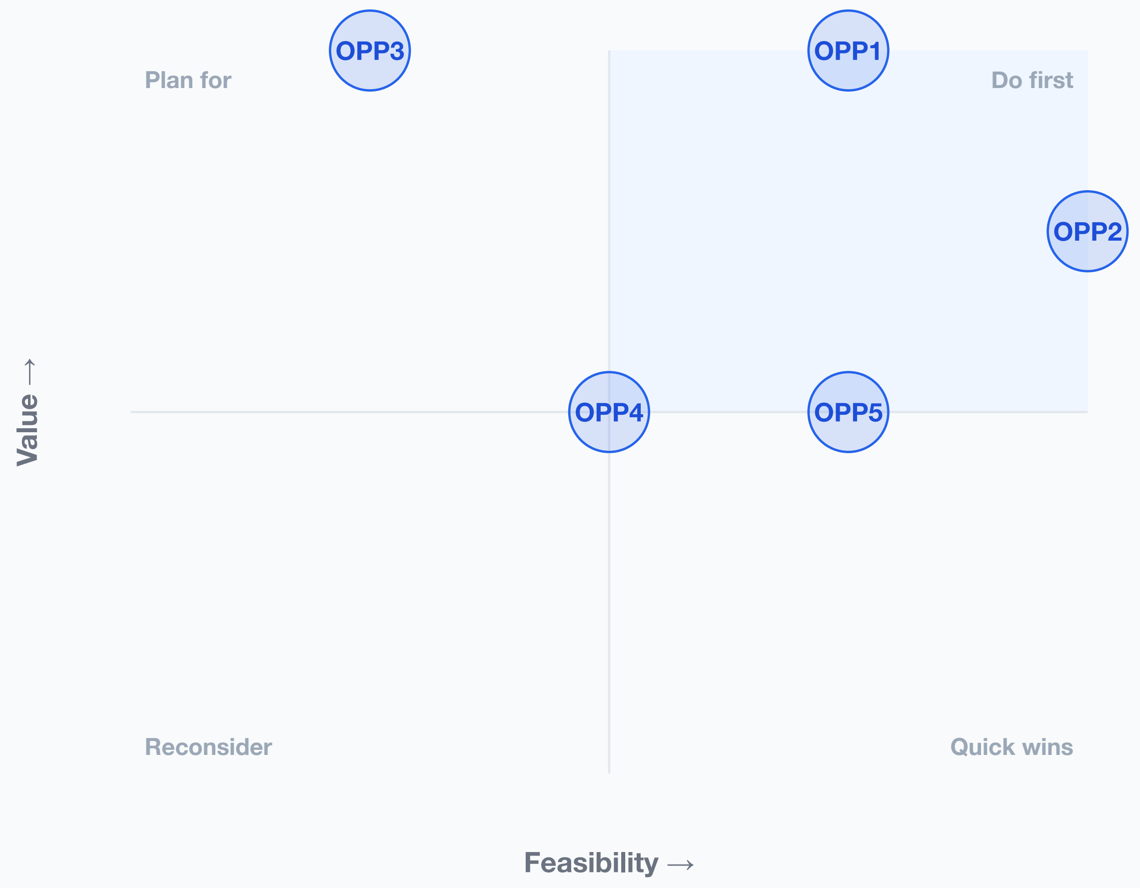
P3

Readiness

The current state can support the near-term moves once the customer master is reconciled; the credit decisioning step is the main capability to build toward.

2 Value vs. feasibility

WHERE EACH OPPORTUNITY SITS ON VALUE VERSUS FEASIBILITY



DO FIRST

Customer Master Reconciliation | EDI Order Exception Handling

PLAN FOR

AI Credit Decisioning | EDI Connection Transition Programme | Customer Master Population Alignment

CONSIDER

None in this quadrant

DEPRIORITISE

None in this quadrant

3 Recommendations

Each opportunity as a recommendation — what it addresses, the phased actions, and what success looks like.

R 01 Customer Master Reconciliation

CRITICAL PRIORITY | H1 | HITL WORKFLOW | Addresses PP1 | Delivers OPP1

Agree a single source of truth for customer credit limits and reconcile the ERP and CRM records, with the credit and commercial teams signing off the canonical values.

Phased actions

- H1 A guided session reviews the conflicting records; the platform surfaces every discrepancy and proposes the canonical value.
- H1 The teams confirm the authoritative credit limit per account.
- H1 A sync rule keeps the two systems aligned going forward.

Success criteria

- A single agreed credit limit per active retail account
- An approval trail for any future limit change

DEPENDENCY

Prerequisite for AI Credit Decisioning.

R 02 EDI Order Exception Handling

CRITICAL PRIORITY | H1 | AUTOMATION PIPELINE | Addresses PP3 | Delivers OPP2

Automate the triage of EDI order exceptions so only genuine ambiguities reach the customer-service team.

Phased actions

- H1 Each exception is classified by type and auto-routed to the right resolution path.
- H1 Genuine ambiguities reach an agent; the rest resolve automatically.

Success criteria

Fewer manual customer-service interventions on EDI exceptions

R 03

AI Credit Decisioning

CRITICAL PRIORITY | H2 | AI OPPORTUNITY | AI AGENT | Addresses PP2 | Delivers OPP3

Apply a real-time credit assessment to the EDI order stream so the channel that carries most of your orders is no longer released without a credit check.

Phased actions

- H2 Each EDI order is assessed against the reconciled customer master and credit policy: approve, hold, or flag.
- H2 Flagged orders go to a credit analyst; approved orders proceed.

Success criteria

Credit assessment coverage of the EDI channel

Low rate of incorrectly held orders

DEPENDENCY

Requires Customer Master Reconciliation first.

R 04

EDI Connection Transition Programme

HIGH PRIORITY | H2 | MODERNISATION | Addresses PP4 | Delivers OPP4

Bring the six EDI connections still operated by the former parent onto the organisation's own platform, so it controls the service end to end.

Phased actions

- H2 Each connection is migrated onto the organisation's own EDI platform on the published schedule.
- H2 Incidents are resolved under the organisation's own service levels, with no dependency on the former parent.

Success criteria

All connections operated on the organisation's own platform

Incident resolution under the organisation's own service levels

R 05

Customer Master Population Alignment

HIGH PRIORITY | H1 | HITL WORKFLOW | Addresses PP5 | Delivers OPP5

Align the two customer masters on which accounts exist, so the credit reconciliation has a clean, complete population to work from.

Phased actions

- H1 The two masters are compared and the missing accounts surfaced for review.
- H1 Missing records are created or retired under a maintained onboarding rule so the populations stay aligned.

Success criteria

- The two masters hold the same active-account population
- A maintained rule keeps them aligned at onboarding

4 Sequencing & readiness

4.1 Prioritization rationale

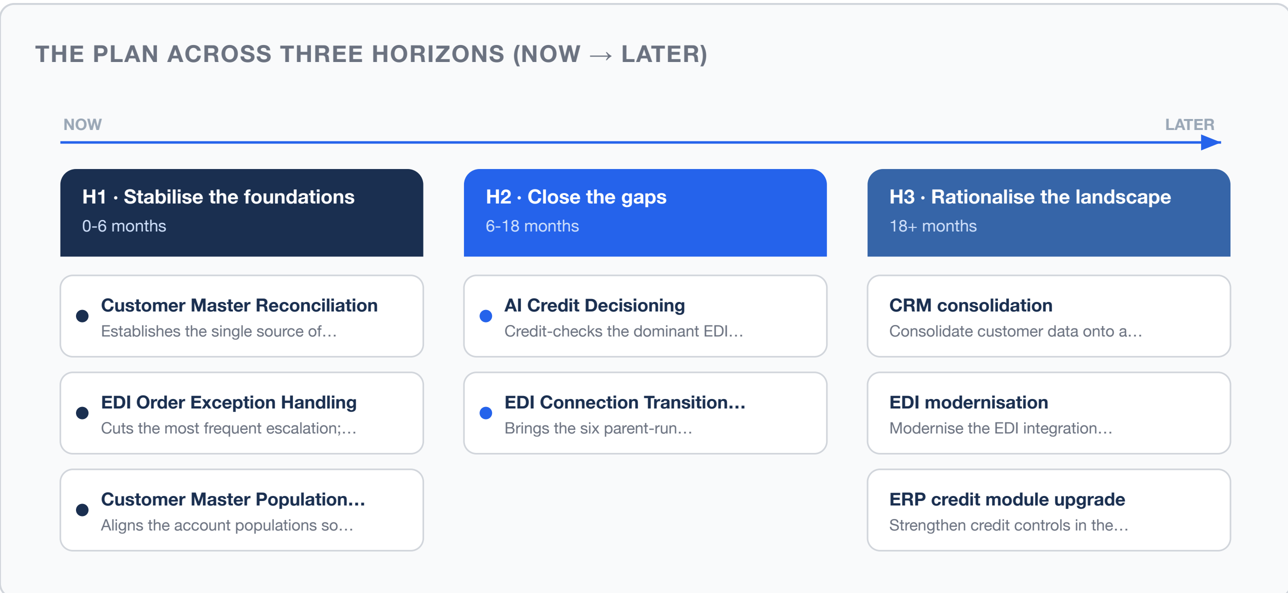
Each opportunity assessed across three readiness dimensions. The rating (high / medium / low) is followed by the reason, so the sequence is defensible rather than asserted.

OPPORTUNITY	DATA READINESS	TECHNICAL COMPLEXITY	OPERATIONAL READINESS
Customer Master Reconciliation	HIGH both credit limits already exist as structured fields in the ERP and CRM; the discrepancy set (267 accounts) is computable directly from the two extracts.	MEDIUM read-and-compare across two SAP systems with a governed write-back; no model judgement on the numbers themselves.	HIGH Credit Control already owns credit decisions in the RACI, so there is a clear accountable owner to run the reconciliation.
EDI Order Exception Handling	HIGH the order-flow export already carries the fulfilment status and channel needed to identify and type EDI exceptions.	LOW a deterministic, auditable rule engine on the EDI stream; no AI judgement required, so it is the simplest to stand up.	MEDIUM Customer Service handles these exceptions today, but EDI has no named owner in the RACI, so accountability for the new process must be assigned first.

OPPORTUNITY	DATA READINESS	TECHNICAL COMPLEXITY	OPERATIONAL READINESS
AI Credit Decisioning	MEDIUM depends on the reconciled customer master from OPP1; until credit limits agree across the two systems, a real-time check cannot be trusted.	HIGH real-time assessment on the live EDI stream against the ERP credit module, with model judgement that must be auditable.	LOW credit analysts must come to trust and act on the agent's flags, and the EDI channel has no named owner today; this needs the foundations (OPP1, EDI ownership) in place first.
EDI Connection Transition Programme	MEDIUM the connection inventory and managing entity are documented, but the governing service terms sit in a schedule not included in the pack.	HIGH a live cutover of production EDI connections between two platforms, coordinated with an external party.	MEDIUM the organisation owns eight connections already and has run two migrations, but the remaining six depend on the former parent's cooperation.
Customer Master Population Alignment	HIGH both account populations are structured fields; the 22-account difference is computable directly from the two extracts.	LOW a compare-and-confirm over two master-data extracts.	MEDIUM the alignment needs a named data steward and a maintained onboarding rule, which do not exist today.

4.2 Implementation roadmap

The recommendations sequenced across three horizons (now → later).

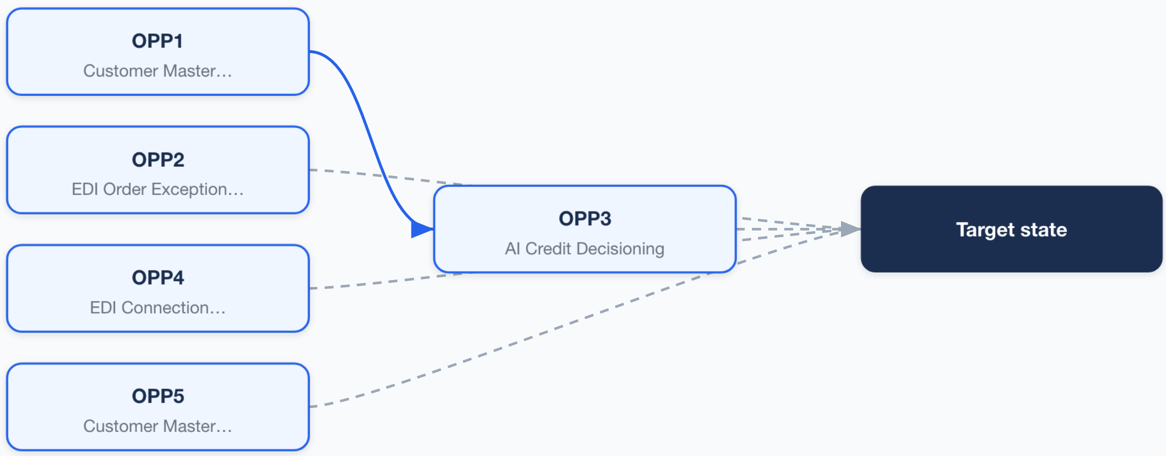


4.3 Sequencing rationale

Customer Master Reconciliation (OPP1) comes first because AI Credit Decisioning (OPP3) needs a clean, single credit limit per account to work. EDI Order Exception Handling (OPP2) and the population alignment (OPP5) are independent and run in parallel from the start; the connection transition (OPP4) follows on the published migration schedule.

Dependencies: OPP3 depends on OPP1. OPP1, OPP2, OPP4 and OPP5 are independent of each other and can run in parallel.

HOW THE OPPORTUNITIES ENABLE ONE ANOTHER



Arrows show enabling relationships; all paths lead to the target state.

4.4 Strategic readiness

The current state can support the near-term moves once the customer master is reconciled; the credit decisioning step is the main capability to build toward.

5 Success metrics

How to measure delivery once live — the baseline today and the directional target.

METRIC	WHAT IT MEASURES	TARGET
Customer-master agreement	Share of the 267 shared retail accounts holding a single agreed credit limit across the ERP and CRM, with an approval trail on any change.	Every one of the 267 shared accounts reconciled, with no unapproved limit change thereafter.
EDI fulfilment rate	Share of EDI orders fulfilled without a manual exception, against the 1,196 (€12.4M) not fulfilled today.	A sustained, material reduction in unfulfilled EDI orders after go-live; the 1,196 baseline is the yardstick.
EDI escalation rate	Customer-service escalations for 'EDI order not processed' — the single most frequent escalation today (34 cases).	A clear downward trend against the 34-case baseline as exceptions resolve automatically.

METRIC	WHAT IT MEASURES	TARGET
EDI credit coverage	Share of the EDI channel (67% of all orders) that receives a systematic credit check before release.	Near-complete credit coverage of the EDI channel once the customer master is reconciled.
Credit-decision accuracy	Share of automated credit assessments (approve/hold/flag) that a credit analyst confirms as correct on review.	A high confirmation rate at go-live, improving through tuning; tracked against analyst review.
EDI connection ownership	Share of the 14 live EDI connections operated on the organisation's own platform rather than the former parent's (8 of 14 today).	All 14 connections on the organisation's own platform on the published migration schedule.
Customer-master population alignment	Whether the ERP and CRM hold the same active-account population (a 22-account difference today).	A single agreed active-account population across both systems, kept aligned at onboarding.

6 Risk register

The delivery risks, how likely and how serious each is, and how it is mitigated.

RISK	LIKELIHOOD	IMPACT	MITIGATION	OWNER
The credit and commercial teams cannot agree the canonical credit limit for a contested account.	MEDIUM	HIGH	Material gaps (e.g. the €600,000 Carrefour France gap) are held for the Credit Controller to adjudicate; nothing auto-resolves.	Credit Controller
The automated EDI exception rules do not cover an edge case, so it still reaches an agent.	MEDIUM	MEDIUM	Unmatched and low-confidence exceptions route to an agent with the source order attached; coverage is reviewed as new types appear.	Customer Service Lead
Credit analysts do not trust the automated credit assessment and override it by default.	MEDIUM	HIGH	Every hold and low-confidence case is shown with its reasoning and the limit used, so analysts can confirm rather than re-derive.	Credit Controller
A TSA connection's migration slips because the former parent's cooperation or service terms are unclear.	HIGH	MEDIUM	Migrate one connection at a time on the published schedule, validating against live order flow before decommissioning.	EDI integration lead

RISK	LIKELIHOOD	IMPACT	MITIGATION	OWNER
ERP-only accounts are added to the CRM when some should instead be retired as inactive.	LOW	MEDIUM	A data steward confirms each create-or-retire decision; ambiguous accounts are held for the account manager.	Data steward

7 Appendix — traceability matrix

Each pain point traced through to the recommendation, opportunity, expected outcome and horizon that addresses it.

PAIN POINT	SUMMARY	SEVERITY	RECOMMENDATION	OPPORTUNITY	EXPECTED OUTCOME	HORIZON
PP1	ERP/CRM disagree on credit limits	High	R-01	OPP1	One agreed credit limit per account, with an approval trail.	H1
PP2	EDI channel undocumented and unowned	High	R-03	OPP3	A credit gate on the channel carrying most order value.	H2
PP3	EDI order failures concentrate here	High	R-02	OPP2	Routine EDI exceptions resolve without an agent.	H1
PP4	Six connections under the former parent	Medium	R-04	OPP4	All connections on the organisation's own platform.	H2
PP5	Customer masters hold different populations	Medium	R-05	OPP5	One agreed active-account population across both systems.	H1

2 Opportunities in detail

Customer Master Reconciliation HITL WORKFLOW

Agree a single source of truth for customer credit limits and reconcile the ERP and CRM records, with the credit and commercial teams signing off the canonical values.

TODAY

1. Order arrives

Customer Service

An order arrives for a major retail account.

2. Credit limit looked up

Credit Control · SAP S/4HANA / SAP CRM

The credit check uses whichever record the system resolves first.

ERP and CRM hold different limits for the same account

No agreed source of truth, no approval trail on overrides

3. Order released

Credit Control

The order is released, sometimes against an inflated limit.

↓

WITH THE CHANGE

1. Reconciliation session

Credit + Commercial

A guided session reviews the conflicting records; the platform surfaces every discrepancy and proposes the canonical value.

2. Canonical limit agreed

Credit Controller

The teams confirm the authoritative credit limit per account.

3. Systems aligned

Finance Systems · SAP S/4HANA / SAP CRM

A sync rule keeps the two systems aligned going forward.

Business impact. Removes the credit-limit disagreement across the largest retail accounts and establishes a single agreed source of truth. **267 of the shared accounts** **€600,000**

How we get there: 267 shared accounts differ today; the largest single gap is Carrefour France at €600,000 (€2.4M in CRM vs €1.8M in ERP).

How it's delivered. A human-in-the-loop reconciliation supported by an assistant that surfaces conflicts and proposes the canonical record; the credit team makes the final call.

Who uses it. Credit Controller, Credit Control analysts, Commercial / account managers, Finance Systems

Expected behaviour. The assistant presents the conflicting ERP and CRM values side by side for each of the 267 shared accounts, proposes the canonical limit with its reasoning, and records the human decision. It never changes a limit on its own — it prepares the decision and writes the agreed value back only after sign-off.

Escalation & human fallback. Where the credit and commercial teams disagree on the canonical value, or the gap is material (e.g. the €600,000 Carrefour France gap), the item is held for the Credit Controller to adjudicate rather than auto-resolved.

Sources. SAP S/4HANA customer master, SAP CRM customer records, Credit Policy **Formats.** Structured master-data export, Governance policy document

Connects: SAP S/4HANA customer master, SAP CRM customer records

Success looks like:

- A single agreed credit limit per active retail account
- An approval trail for any future limit change

Dependencies: Independent — can start immediately. Prerequisite for AI Credit Decisioning.

Risks:

- The credit and commercial teams must agree the canonical-record rules

Where this comes from: SAP S/4HANA Customer Master Export, SAP CRM Customer Export, Accounts Receivable Review Notes Q4 2025 and Credit Management Policy Europe

EDI Order Exception Handling AUTOMATION PIPELINE

Automate the triage of EDI order exceptions so only genuine ambiguities reach the customer-service team.

TODAY

1. EDI exception raised

Order management

An EDI order fails or is flagged.

2. Manual triage

Customer Service

An agent classifies, routes and resolves it by hand.

No classification or auto-routing | EDI-not-processed is the top escalation

WITH THE CHANGE

1. Exception classified

Rule engine

Each exception is classified by type and auto-routed to the right resolution path.

2. Only ambiguities escalate

Customer Service

Genuine ambiguities reach an agent; the rest resolve automatically.

Business impact. Reduces the manual customer-service load from EDI exceptions, which are today the most frequent escalation. **34 escalations**

How we get there: EDI orders not processed account for 34 of the customer-service escalations.

How it's delivered. A deterministic, auditable rule engine on the EDI order stream; no AI judgement required.

Who uses it. Customer Service agents, Customer Service Lead

Expected behaviour. Each EDI exception is classified by type against the documented rules and auto-routed to its resolution path. Clear-cut cases (the bulk of the 1,196 unfulfilled EDI orders) resolve without a person; the agent's queue holds only genuine ambiguities.

Escalation & human fallback. Any exception that does not match a known rule, or that the rule engine classifies with low confidence, is routed to a Customer Service agent with the classification and source order attached — nothing is silently dropped.

Sources. EDI / order-management channel, Order Management SOP, Customer-service escalation log **Formats.** Structured transactional export, Operational log

Connects: EDI / order management, Order management module

Success looks like:

- Fewer manual customer-service interventions on EDI exceptions

Dependencies: Independent — can start immediately.

Risks:

- Rule completeness — uncovered edge cases will still reach the team

Where this comes from: Customer Service Escalation Log 2025, Order Flow Analysis Export 2025 and EDI Dispute Resolution CS Working Notes

AI Credit Decisioning AI AGENT

Apply a real-time credit assessment to the EDI order stream so the channel that carries most of your orders is no longer released without a credit check.

TODAY

1. EDI order arrives

Order management

An EDI order is received on the dominant channel.

2. Released without a credit gate

—

The order proceeds to fulfilment with no systematic credit check on the EDI channel.

No credit gate on the channel carrying 67% of orders

↓

WITH THE CHANGE

1. Real-time credit assessment

AI Agent · SAP S/4HANA credit + EDI stream

Each EDI order is assessed against the reconciled customer master and credit policy: approve, hold, or flag.

2. Analyst reviews flags

Credit Control

Flagged orders go to a credit analyst; approved orders proceed.

Business impact. Brings a credit check to the EDI channel that carries 67% of orders, closing the coverage gap once the customer master is clean. **67% of orders**

How we get there: EDI carries 67% of orders (5,667 of 8,420); today these are released without a systematic credit check.

How it's delivered. An AI agent on the EDI order stream that approves, holds or flags each order; escalates low-confidence cases to a human.

Who uses it. Credit Control analysts, Credit Controller, Customer Service (downstream)

Expected behaviour. For each EDI order the agent reads the reconciled customer master and the Credit Policy and returns one of three outcomes — approve, hold, or flag — with the reasoning shown. Approved orders proceed to fulfilment; held and flagged orders wait for a human decision.

Escalation & human fallback. Low-confidence assessments and every 'hold' are routed to a credit analyst with the order, the limit used and the reasoning, so the analyst makes the final call. The agent never releases a held order on its own.

Sources. Reconciled customer master (from OPP1), Credit Policy, EDI order stream **Formats.** Structured transactional export, Governance policy document

Connects: SAP S/4HANA credit module, Reconciled customer master (OPP1), EDI order stream

Success looks like:

- Credit assessment coverage of the EDI channel
- Low rate of incorrectly held orders

Dependencies: Requires Customer Master Reconciliation first.

Risks:

- Needs the reconciled customer master (OPP1) first
- Credit analysts must trust and act on the agent's flags

Where this comes from: Order Flow Analysis Export 2025 and O2C Process RACI Europe

EDI Connection Transition Programme MODERNISATION

Bring the six EDI connections still operated by the former parent onto the organisation's own platform, so it controls the service end to end.

TODAY

1. Incident on a parent-run connection

Customer Service

An EDI incident occurs on one of the six connections operated by the former parent.

2. Resolution waits on the parent

Former parent IT

Resolution depends on the parent's team under the transitional arrangement.

No control over response times on these connections

Governing service terms are not in the organisation's hands

↓

WITH THE CHANGE

1. Connection migrated

EDI integration team · Own EDI platform

Each connection is migrated onto the organisation's own EDI platform on the published schedule.

2. Service owned end to end

EDI integration team

Incidents are resolved under the organisation's own service levels, with no dependency on the former parent.

Business impact. Removes the dependency on the former parent for the connections carrying several of the largest retail accounts. **6 of 14 connections**

How we get there: Six of the fourteen live connections remain under the transitional arrangement today.

How it's delivered. A phased migration on the published schedule, one connection at a time, validated against live order flow before the parent's connection is decommissioned.

Who uses it. EDI integration team, Customer Service, Commercial / account managers

Expected behaviour. Each of the six connections is migrated to the organisation's own platform on the schedule and validated against live order flow before the parent's connection is retired. The programme touches one connection at a time so order flow is never interrupted.

Escalation & human fallback. Where a connection's service terms or migration date are unclear, the item is held for the EDI integration lead and the transition programme office rather than migrated blind.

Sources. EDI integration register, EDI dispute working notes **Formats.** Technical register, Operational working notes

Connects: Own EDI platform, Former parent's EDI platform (during cutover)

Success looks like:

- All connections operated on the organisation's own platform
- Incident resolution under the organisation's own service levels

Dependencies: Independent — can start immediately.

Risks:

- The governing service terms are not in the document pack
- Migration dates for the later connections are provisional

Where this comes from: EDI Integration Register Europe and EDI Dispute Resolution CS Working Notes

Customer Master Population Alignment HITL WORKFLOW

Align the two customer masters on which accounts exist, so the credit reconciliation has a clean, complete population to work from.

TODAY

1. Account created in the ERP

Customer Service

A new account is set up in the ERP.

2. No matching CRM record

—

No matching record is maintained in the CRM.

22 accounts exist in the ERP with no CRM counterpart | Any process reading the CRM misses them

↓

WITH THE CHANGE

1. Populations compared

Data steward · ERP / CRM

The two masters are compared and the missing accounts surfaced for review.

2. Records aligned & governed

Data steward

Missing records are created or retired under a maintained onboarding rule so the populations stay aligned.

Business impact. Aligns the account populations so the credit reconciliation works from a complete, agreed set of accounts. **22 accounts**

How we get there: The ERP holds 340 active accounts to the CRM's 318 — a 22-account difference.

How it's delivered. A human-in-the-loop alignment: the platform surfaces the population difference and a data steward confirms each create-or-retire decision.

Who uses it. Data steward, Commercial / account managers, Finance Systems

Expected behaviour. The platform lists the accounts present in one master but not the other and proposes a create-or-retire action for each; a data steward confirms every decision. It never creates or retires a record on its own.

Escalation & human fallback. Any account whose status is ambiguous (e.g. possibly inactive) is held for the data steward and the account manager to decide rather than auto-aligned.

Sources. SAP S/4HANA customer master, SAP CRM customer records **Formats.** Structured master-data export

Connects: SAP S/4HANA customer master, SAP CRM customer records

Success looks like:

- The two masters hold the same active-account population
- A maintained rule keeps them aligned at onboarding

Dependencies: Independent — can start immediately.

Risks:

- Some ERP-only accounts may be legitimately inactive and need retiring, not adding

Customer Master Population… Aligns the account populations so…		**ERP credit module upgrade** Strengthen credit controls in the…

2 Horizon detail

H1 — Stabilise the foundations (0-6 months)

- **Customer Master Reconciliation** opportunity — Establishes the single source of truth the rest depends on.
- **EDI Order Exception Handling** opportunity — Cuts the most frequent escalation; independent, can run now.
- **Customer Master Population Alignment** opportunity — Aligns the account populations so the reconciliation is clean.

H2 — Close the gaps (6-18 months)

- **AI Credit Decisioning** opportunity — Credit-checks the dominant EDI channel; needs OPP1 first.
- **EDI Connection Transition Programme** opportunity — Brings the six parent-run connections onto the own platform.

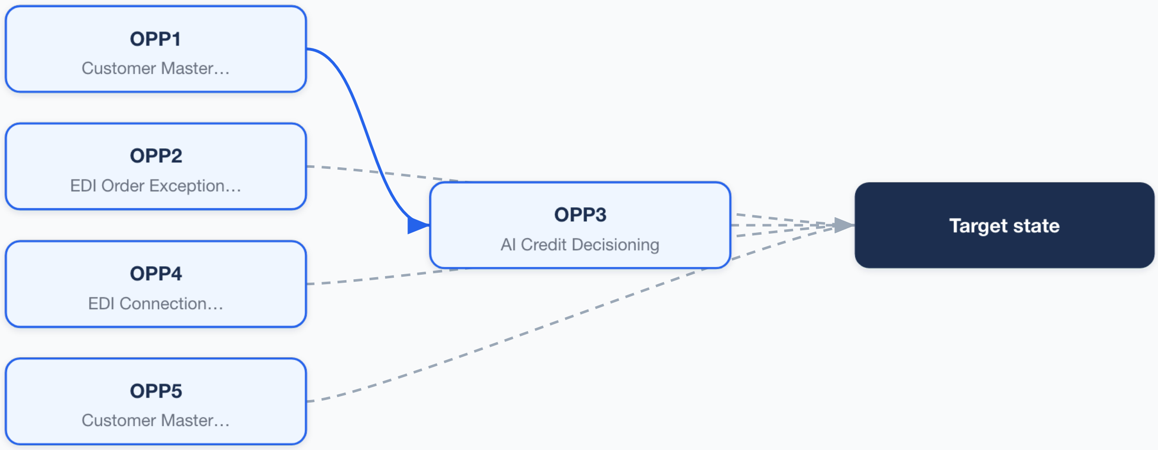
H3 — Rationalise the landscape (18+ months)

- **CRM consolidation** — Consolidate customer data onto a single platform.
- **EDI modernisation** — Modernise the EDI integration estate.
- **ERP credit module upgrade** — Strengthen credit controls in the core ERP.

3 How the work connects

The enabling relationships between the opportunities — what unlocks what.

HOW THE OPPORTUNITIES ENABLE ONE ANOTHER



Arrows show enabling relationships; all paths lead to the target state.

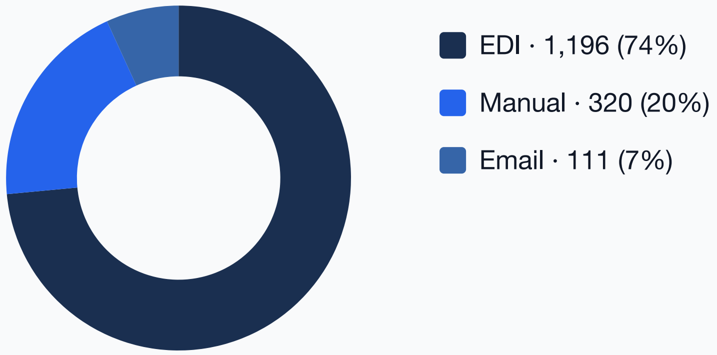
2 Success metrics framework

How the impact of the recommended interventions should be measured once live — the dimension, what it means, and the target to hold delivery to.

METRIC	DEFINITION	TARGET
Customer-master agreement	Share of the 267 shared retail accounts holding a single agreed credit limit across the ERP and CRM, with an approval trail on any change.	Every one of the 267 shared accounts reconciled, with no unapproved limit change thereafter.
EDI fulfilment rate	Share of EDI orders fulfilled without a manual exception, against the 1,196 (€12.4M) not fulfilled today.	A sustained, material reduction in unfulfilled EDI orders after go-live; the 1,196 baseline is the yardstick.
EDI escalation rate	Customer-service escalations for 'EDI order not processed' — the single most frequent escalation today (34 cases).	A clear downward trend against the 34-case baseline as exceptions resolve automatically.
EDI credit coverage	Share of the EDI channel (67% of all orders) that receives a systematic credit check before release.	Near-complete credit coverage of the EDI channel once the customer master is reconciled.
Credit-decision accuracy	Share of automated credit assessments (approve/hold/flag) that a credit analyst confirms as correct on review.	A high confirmation rate at go-live, improving through tuning; tracked against analyst review.
EDI connection ownership	Share of the 14 live EDI connections operated on the organisation's own platform rather than the former parent's (8 of 14 today).	All 14 connections on the organisation's own platform on the published migration schedule.
Customer-master population alignment	Whether the ERP and CRM hold the same active-account population (a 22-account difference today).	A single agreed active-account population across both systems, kept aligned at onboarding.

3 Where the failures concentrate

SHARE OF UNFULFILLED ORDERS BY CHANNEL



4 System & data-flow map

The systems view of the same domain — which business systems the process touches and how data moves between them.

SYSTEMS THE PROCESS TOUCHES, AND HOW DATA MOVES BETWEEN THEM
