Executive Summary

EDI now carries roughly two-thirds of the organisation Europe's order flow (67.3% of orders and 66.8% of order value, worth EUR 59,711,399.53) yet sits outside the governed process — and 1,196 EDI orders worth EUR 12,362,493.74 went unfulfilled.

1 At a glance

1.1 Situation & opportunity

The situation

the organisation Europe's order-to-cash operation runs on a channel that its own governance does not cover. EDI accounts for 67.3% of orders by count and 66.8% of order value (EUR 59,711,399.53), but the Order Management SOP states plainly that 'EDI is not covered by this version of the SOP' and the O2C RACI covers only manual and email channels, leaving no defined owner for EDI dispute resolution.

The operational cost is visible: 1,196 EDI orders worth EUR 12,362,493.74 were unfulfilled, and 'EDI order not processed — manual intervention required' is the single largest escalation root cause at 34 cases (23.9% of all escalations).

Compounding the risk, customer master data is inconsistent across systems: of 318 matched accounts, 267 show a mismatched credit limit and 228 a mismatched payment term, with aggregate absolute credit-limit divergence of EUR 30,675,000.

The credit policy names SAP S/4HANA as the 'sole authoritative source,' yet review notes confirm 'our credit policy does not define which system is authoritative' in practice — Carrefour France alone differs by EUR 600,000 (ERP EUR 1,800,000 vs CRM EUR 2,400,000).

The opportunity

The largest, most controllable value sits in closing the EDI governance gap: bringing the channel that handles 67.3% of orders under a defined SOP and RACI directly addresses the EUR 12,362,493.74 of unfulfilled EDI orders and the 34 manual-

intervention escalations (23.9% of the total). In parallel, establishing a single authoritative source for credit data would resolve mismatches across 267 of 318 accounts and remove EUR 30,675,000 of credit-limit divergence that today drives pricing and credit disputes. Recommended first move: formally extend process ownership to the EDI channel and designate the authoritative customer-master system, since both gaps are documented, high-volume, and within the organisation's direct control.

Current State Assessment

How Order-to-Cash runs today. A factual baseline of the process, the systems that support it, and how information is structured — stated as fact, no judgements.

1 Domain overview

1.1 Context and scope

This section documents the current-state Order-to-Cash (O2C) operating environment for the organisation Europe across two dimensions: order intake and fulfilment across multiple channels, and customer master governance across the ERP and CRM systems. Customer orders enter through Electronic Data Interchange (EDI), Manual (telephone), Email, Phone, and Fax channels. Customer credit limits and payment terms are held in both SAP S/4HANA (ERP) and SAP CRM. The order-management SOP and the O2C RACI describe Manual and Email handling; EDI is documented separately in customer-service working notes.

Orders are received across EDI, Manual, Email, Phone, and Fax channels. EDI accounts for 5,667 orders — 67.3% of order rows and €59,711,399.53 (66.8% of order value). When an EDI purchase order is not processed automatically, customer service manually re-enters the order while the issue is investigated. Customer credit limits and payment terms are recorded in both SAP S/4HANA and SAP CRM; the credit-management policy designates SAP S/4HANA as the sole authoritative source. Across 318 matched accounts, 267 carry a differing credit_limit_eur between the two systems and 228 carry differing payment_terms.

1.2 Volume baseline

2 Process flow

The end-to-end flow, who performs each step and on which system:

HOW WORK MOVES, END TO END

STEP	PERFORMED BY	SYSTEM	WHAT HAPPENS
1. Order receipt — EDI channel	EDI integration	EDI / SAP S/4HANA	Customer purchase orders arrive through the EDI channel, which processes purchase orders automatically. EDI accounts for 5,667 orders, 67.3% of rows, and €59,711,399.53 (66.8% of value).
2. Order receipt — Manual, Email, Phone, Fax channels	Customer Service	SAP S/4HANA	Orders also arrive by Manual (telephone), Email, Phone, and Fax. The order-management SOP and the O2C RACI cover Manual (telephone) and Email order channels; EDI is not covered by that version of the SOP.
3. EDI exception handling — manual re-entry	Customer Service	SAP S/4HANA	When an EDI order is not processed automatically, customer service manually re-enters the order while the EDI issue is investigated. 'EDI order not processed — manual intervention required' accounts for 34 escalation cases (23.9% of all escalations).
4. Fulfilment outcome	Customer Service	SAP S/4HANA	Order outcomes are tracked by channel. 1,196 EDI orders are recorded NOT_FULFILLED at €12,362,493.74; 320 Manual orders and 111 Email orders are recorded unfulfilled.
5. Credit master maintenance	Credit Management	SAP S/4HANA / SAP CRM	Customer credit limits and payment terms are held in both SAP S/4HANA and SAP CRM. The credit-management policy states SAP S/4HANA is the sole authoritative source for all customer credit limits. Across 318 matched accounts, 267 differ on credit_limit_eur and 228 differ on payment_terms.

3 Process inventory

Each stage of the process in detail — how it runs today, who performs it, and on which system.

EDI order intake and automatic processing

EDI integration · EDI / SAP S/4HANA

The EDI channel processes purchase orders automatically and accounts for around 67% of total order volume. In the order flow export this is recorded as 5,667 orders, 67.3% of rows, €59,711,399.53, and 66.8% of value.

Source: EDI Dispute Resolution CS Working Notes and Order Flow Analysis Export 2025

Manual and Email order handling

Customer Service · SAP S/4HANA

The order-management SOP and the O2C RACI cover Manual (telephone) and Email order channels. EDI is not covered by that version of the SOP, and there is no row in the O2C RACI for EDI.

Source: Order Management SOP Europe, O2C Process RACI Europe and EDI Dispute Resolution CS Working Notes

EDI exception re-entry

Customer Service · SAP S/4HANA

When an EDI order is not processed, the documented action is to manually re-enter the order while the EDI issue is investigated, and not to wait. The escalation log records 34 such cases (23.9%) under 'EDI order not processed — manual intervention required'.

Source: EDI Dispute Resolution CS Working Notes and Customer Service Escalation Log 2025

Credit master maintenance across ERP and CRM

Credit Management · SAP S/4HANA / SAP CRM

Customer credit limits and payment terms are held in both SAP S/4HANA and SAP CRM. The credit-management policy states SAP S/4HANA is the sole authoritative source for all customer credit limits. The accounts-receivable review notes state the credit policy does not define which system is authoritative. For Carrefour France, ERP holds €1,800,000 / NET45 and CRM holds €2,400,000 / NET30.

Source: Credit Management Policy Europe, Accounts Receivable Review Notes Q4 2025, SAP S/4HANA Customer Master Export and SAP CRM Customer Export

4 Ownership map

4.1 RACI matrix

ACTIVITY	RESPONSIBLE	ACCOUNTABLE
Manual (telephone) order handling	Customer Service	Customer Service
Email order handling	Customer Service	Customer Service
EDI dispute resolution	Customer Service	Customer Service

5 System inventory

SYSTEM	ROLE	SYSTEM OF RECORD FOR
SAP S/4HANA (ERP)	Order processing and customer master	Customer credit limits and payment terms (per credit-management policy)
SAP CRM	Customer master record	Customer credit limit and payment term records held in CRM
EDI integration	Automatic purchase order intake	EDI order receipt

5.1 System profiles

Each system that supports this process — what it is, how it is used, who owns it, and the constraints observed.

SAP S/4HANA (ERP)

Order processing and customer master of record

How it's used. Holds customer credit limits and payment terms; the credit-management policy designates it the sole authoritative source for all customer credit limits.

Ownership & access. Credit Management

Observed constraints. For Carrefour France it holds a credit limit of €1,800,000 and payment terms NET45, which differ from the CRM record.

SAP CRM

Customer master record

How it's used. Holds customer credit limit and payment term records; for Carrefour France it holds €2,400,000 and NET30.

Ownership & access. Credit Management

Observed constraints. Across 318 matched accounts, 267 differ from ERP on `credit_limit_eur` and 228 differ on `payment_terms`.

EDI integration

Automatic order intake

How it's used. Processes purchase orders automatically; accounts for 5,667 orders (67.3% of rows) and €59,711,399.53 (66.8% of value).

Ownership & access. Customer Service (per EDI dispute working notes)

Observed constraints. EDI is not covered by the order-management SOP and has no row in the O2C RACI; 1,196 EDI orders are recorded NOT_FULFILLED at €12,362,493.74.

5.2 Information format & structure

The patterns the source information follows — this drives how it can be ingested and reasoned over.

PATTERN	DESCRIPTION	WHERE IT APPEARS
EDI	Electronic Data Interchange channel processing purchase orders automatically.	5,667 orders; 67.3% of rows; €59,711,399.53; 66.8% of value
Manual	Manual (telephone) order channel covered by the O2C RACI and SOP.	CS-2025-0002 (Carrefour France); CS-2025-0005 (Mercadona)
Email	Email order channel covered by the O2C RACI and SOP.	CS-2025-0011 (Coop Group)
Phone	Phone channel recorded in the customer service escalation log.	CS-2025-0003 (Tesco UK); CS-2025-0004 (Lidl Europe)
Fax	Fax order channel recorded in the order flow export.	Fax orders recorded in the order flow export

6 Handoff map

How work crosses between steps and systems — each handoff is where information changes hands or format.

WHERE WORK CROSSES BETWEEN STEPS AND SYSTEMS

Boxes are process steps; arrows are the handoffs recorded between them.

- EDI automatic intake → Customer Service manual re-entry *(When an EDI order is not processed, the order is manually re-entered while the EDI issue is investigated.)*
- Order intake (all channels) → Fulfilment outcome tracking *(Orders recorded as fulfilled or NOT_FULFILLED in the order flow export by channel.)*
- SAP S/4HANA credit master → SAP CRM credit record *(Credit limit and payment term values held in parallel across ERP and CRM customer master records.)*

Pain Points & Opportunities

The issues found in the discovery, ranked by business impact, each mapped to a recommended opportunity.

1 Issues at a glance

ISSUES RANKED BY BUSINESS IMPACT (MOST MATERIAL FIRST)

UNFULFILLED ORDERS BY CHANNEL

2 Root cause

How the issues found trace back to shared structural causes:

HOW THE ISSUES TRACE BACK TO SHARED CAUSES

Left: structural causes. Right: the pain points each one drives.

No enforced single source of record. Both the credit/master-data issues (PP3, PP4) and the EDI governance gap (PP1) stem from authority not being defined or enforced: the credit policy names S/4HANA as authoritative but does not define which system is authoritative in practice, and the dominant order channel has no documented owner.

High-volume activity falling into manual workarounds. EDI carries two-thirds of order volume and value yet sits outside the SOP and RACI, so failures are handled by manual re-entry (PP1, PP2) and feed the largest single category of customer escalations (PP5).

Major retail accounts repeatedly affected. The same large customers (Carrefour, Lidl, Coop, Mercadona, Boots, dm, E.Leclerc) appear across master-data divergence, unfulfilled orders and escalations, concentrating risk in the most strategic accounts.

3 Pain points in detail

PP
01

EDI order failures drop into an undocumented manual gap

HIGH SEVERITY

ORDER MANAGEMENT / CHANNEL ...

EDI is the dominant order channel yet it is explicitly excluded from both the Order Management SOP and the O2C RACI, leaving no documented owner or process when an automated order fails. When EDI orders do not flow through, customer service staff are instructed to manually re-key them as a workaround.

67.3% EDI SHARE OF ORDERS BY COUNT	66.8% EDI SHARE OF ORDER VALUE	€59.7M EDI ORDER VALUE	34 EDI-NOT-PROCESSED ESCALATIONS
---	---	----------------------------------	---

EDI channel: scale versus governance coverage

DIMENSION	VALUE	EVIDENCE

Share of order value	66.8%	order-flow-analysis-export-2025
EDI order value (EUR)	59,711,399.53	order-flow-analysis-export-2025
Covered by Order Management SOP	No	order-management-sop-the organisation-europe
Row in O2C RACI	No	o2c-process-raci-the organisation-europe
RACI for EDI dispute resolution	None	edi-dispute-resolution-cs-working-notes

The channel carrying two-thirds of order volume and value sits outside the documented SOP and RACI.

Source: Order Flow Analysis Export 2025, Order Management SOP Europe, O2C Process RACI Europe and EDI Dispute Resolution CS Working Notes

Root cause: EDI channel operations are out of scope for the governing SOP and there is no row in the O2C RACI for EDI dispute resolution, so the channel that carries the majority of order volume has no documented process ownership.

BUSINESS IMPACT

Order value at risk and recurring manual rework, with the single largest category of customer escalations tied directly to unprocessed EDI orders.

ADDRESSED BY

OPP1 — see the Opportunity Portfolio.

Where this comes from: Order Management SOP Europe, O2C Process RACI Europe, EDI Dispute Resolution CS Working Notes and Order Flow Analysis Export 2025

PP
02**Unfulfilled orders concentrated in the EDI channel**

HIGH SEVERITY

ORDER FULFILMENT

A large block of orders ends in a not-fulfilled state, and the EDI channel carries the overwhelming majority of both the count and the value of those failures, far exceeding the manual and email channels.

1,196UNFULFILLED EDI
ORDERS**€12.4M**UNFULFILLED EDI

EDI	1,196	12,362,493.74
Manual	320	—
Email	111	—

Value is verified for EDI only; manual and email values not provided.

Source: Order Flow Analysis Export 2025, EDI Dispute Resolution CS Working Notes and Customer Service Escalation Log 2025

Root cause: EDI order failures lack an owned recovery process (see PP1), so when automated orders do not complete they are not reliably rescued before they lapse.

BUSINESS IMPACT

Material order value going unfulfilled, representing lost or delayed revenue and downstream customer dissatisfaction.

ADDRESSED BY

OPP3 — see the Opportunity Portfolio.

Where this comes from: Order Flow Analysis Export 2025, EDI Dispute Resolution CS Working Notes and Customer Service Escalation Log 2025

PP
03**Credit limits diverge between CRM and ERP with no authoritative source**

HIGH SEVERITY

MASTER DATA / CREDIT MANAGE...

Of 318 matched accounts, the majority hold a different credit limit in CRM than in ERP, and the credit policy does not define which system is authoritative even though policy

text asserts S/4HANA should be the sole source of record. The aggregate absolute divergence across accounts is substantial.

267

ACCOUNTS WITH MISMATCHED
CREDIT L...

AGGREGATE ABSOLUTE CREDIT-
LIMIT D...

228

ACCOUNTS WITH MISMATCHED
PAYMENT ...

Credit-limit discrepancy register (illustrative account)

ACCOUNT	ERP (S/4HANA) CREDIT LIMIT	CRM CREDIT LIMIT	LARGEST SINGLE DELTA	ERP TERMS	CRM TERMS
Carrefour France (FR001)	1,800,000	2,400,000	600,000	NET45	NET30

Carrefour France is the largest single credit-limit delta; values from ERP and CRM master exports.

Source: SAP S/4HANA Customer Master Export, SAP CRM Customer Export and Accounts Receivable Review Notes Q4 2025

Root cause: The credit policy states S/4HANA is the single authoritative source but, in practice, the policy does not define which system is authoritative, allowing two systems to hold conflicting credit limits.

BUSINESS IMPACT

Credit decisions and order releases can be based on the wrong limit, creating credit-risk exposure and disputes.

ADDRESSED BY

OPP2 — see the Opportunity Portfolio.

Where this comes from: Accounts Receivable Review Notes Q4 2025, Credit Management Policy Europe, SAP CRM Customer Export and SAP S/4HANA Customer Master Export

PP
04

Payment terms inconsistent across systems

MEDIUM SEVERITY

MASTER DATA / ORDER-TO-CASH

A significant number of matched accounts carry different payment terms in CRM versus ERP, illustrated by Carrefour France showing NET45 in ERP and NET30 in CRM. This compounds the credit-limit divergence on the same master records.

228

ACCOUNTS WITH MISMATCHED PAYMENT ...

Payment-terms mismatch (illustrative account)

ACCOUNT	ERP TERMS	CRM TERMS
Carrefour France (FR001)	NET45	NET30

Source: SAP S/4HANA Customer Master Export and SAP CRM Customer Export

Root cause: The same absence of an enforced single source of record that drives credit-limit divergence also leaves payment terms unreconciled between the two systems.

BUSINESS IMPACT
Risk of invoicing on incorrect terms, downstream payment-application and pricing disputes.

ADDRESSED BY
OPP4 — see the Opportunity Portfolio.

Where this comes from: Accounts Receivable Review Notes Q4 2025, Credit Management Policy Europe, SAP CRM Customer Export and SAP S/4HANA Customer Master Export

PP
05

Long, variable escalation resolution times and recurring dispute themes

MEDIUM SEVERITY

CUSTOMER SERVICE / DISPUTE ...

The escalation log shows wide variation in resolution time and recurring dispute themes — pricing discrepancies on invoice, delivery short/quantity variance and EDI processing failures appear repeatedly across major retail customers, with several cases taking multiple days to resolve.

34

EDI-NOT-PROCESSED ESCALATIONS

23.9%

SHARE OF ALL ESCALATIONS

Sample escalation cases with resolution time (hours)

CASE	CUSTOMER	CHANNEL	ROOT CAUSE	RESOLUTION (HRS)
CS-2025-0004	Lidl Europe	Phone	Pricing discrepancy on invoice	67

CASE	CUSTOMER	CHANNEL	ROOT CAUSE	RESOLUTION (HRS)
CS-2025-0011	Coop Group	Email	Pricing discrepancy on invoice	54
CS-2025-0006	Mercadona	EDI	Pricing discrepancy on invoice	52
CS-2025-0009	Boots UK	EDI	EDI order not processed	48
CS-2025-0008	dm (Drogerie Markt)	Phone	Returns authorisation requested	43
CS-2025-0007	dm (Drogerie Markt)	EDI	Delivery date change requested	41
CS-2025-0010	Coop Group	Manual	Customer query — payment application	37
CS-2025-0012	E.Leclerc	Manual	Credit note dispute	34
CS-2025-0003	Tesco UK	Phone	Delivery short — quantity variance	26
CS-2025-0005	Mercadona	Manual	Product substitution query	16
CS-2025-0001	Lidl Europe	EDI	EDI order not processed	6
CS-2025-0002	Carrefour France	Manual	Delivery short — quantity variance	3

Selected cases from the 2025 escalation log; resolution time varies from 3 to 67 hours.

Source: Customer Service Escalation Log 2025

Root cause: Disputes span channels and root causes that lack consistent ownership (notably EDI), so resolution depends on manual handling and varies widely in duration.

BUSINESS IMPACT

Sustained customer-service load and customer-experience risk among the largest accounts.

ADDRESSED BY

OPP5 — see the Opportunity Portfolio.

Where this comes from: Customer Service Escalation Log 2025 and O2C Process RACI Europe

PP
06

Orders still arriving via Fax and Email despite EDI dominance

LOWER SEVERITY

ORDER MANAGEMENT / CHANNEL ...

Order-flow records show orders placed through Fax and Email channels alongside EDI and Manual, indicating a persistent low-automation tail that requires manual handling and is not consistently covered by automated processing.

111

UNFULFILLED EMAIL ORDERS

Examples of non-EDI / non-Manual order intake

ORDER	CUSTOMER	CHANNEL	UNITS ORDERED
ORD-2025-08372	Lidl Europe	Fax	1,308
ORD-2025-07971	Lidl Europe	Email	1,425

Source: Order Flow Analysis Export 2025

Root cause: Multiple legacy intake channels remain in use without consolidation, requiring manual handling outside the EDI flow.

BUSINESS IMPACT

Additional manual processing effort and inconsistency in how orders are captured and resolved.

Where this comes from: Order Flow Analysis Export 2025 and Customer Service Escalation Log 2025

Transformation Recommendation

Which opportunities to pursue, in what order, by value and feasibility.

1 Transformation intent

A future state in which SAP S/4HANA operates as the undisputed single system of record for all customer credit limits and payment terms, with CRM systematically reconciled to it, eliminating the current condition where 267 of 318 matched accounts diverge on credit limit and 228 diverge on payment terms. Credit policy explicitly defines the authoritative source, closing the gap that today leaves an aggregate absolute credit-limit divergence of EUR 30,675,000 unresolved. In parallel, the EDI channel — which carries 67.3% of order count and 66.8% of order value — is fully governed by the order-management SOP and represented in the O2C RACI with named accountability, supported by a defined EDI dispute-resolution and exception-handling process. The result is a sharp reduction in the 1,196 unfulfilled EDI orders (EUR 12,362,493.74) and in the 34 escalations (23.9% of total) caused by EDI orders requiring manual intervention, replacing manual re-entry with monitored, automated straight-through processing.

1.1 Guiding principles

P1

Strategic direction

Stabilise-then-standardise: close the highest-volume operational gaps first (EDI fulfilment and governance), then establish a single authoritative source for customer master data, then build durable controls and monitoring.

P2

Sequencing

Two structural gaps surface from the evidence and should be addressed in a deliberate order.

P3

Readiness

Readiness is mixed.

2 Value vs. feasibility

WHERE EACH OPPORTUNITY SITS ON VALUE VERSUS FEASIBILITY

DO FIRST

Address: EDI order failures drop into an undocumented manual gap

Address: Unfulfilled orders concentrated in the EDI channel

Address: Credit limits diverge between CRM and ERP with no authoritative source

PLAN FOR

Address: Payment terms inconsistent across systems

Address: Long, variable escalation resolution times and recurring dispute themes

Address: Orders still arriving via Fax and Email despite EDI dominance

CONSIDER

None in this quadrant

DEPRIORITISE*None in this quadrant***3 Recommendations**

Each opportunity as a recommendation — what it addresses, the phased actions, and what success looks like.

**R
01****Address: EDI order failures drop into an undocumented manual gap****CRITICAL PRIORITY****HITL WORKFLOW**

Addresses PP1 | Delivers OPP1

When an inbound EDI order fails to convert into a sales order in SAP S/4, there is no documented, owned procedure to catch, route, and reprocess it. The failure surfaces only when a customer or sales contact chases the missing delivery, by which point the order has often aged past its requested ship window. The EDI integration register and customer service working notes confirm that rejected or unmapped transmissions are handled ad hoc by individual Customer Service agents rather than through a defined exception workflow. This opportunity introduces a human-in-the-loop exception queue: every failed EDI inbound is captured, triaged against a known set of failure reasons, and either auto-corrected or routed to a named owner with a resolution clock — closing the silent gap between "EDI sent" and "order created".

Phased actions

- H1** Customer sends an inbound EDI purchase order through the established trading-partner connection, unchanged from today.
- H1** Any inbound EDI message that fails to create a sales order is automatically captured into a monitored exception queue with its failure reason, rather than being lost.
- H1** Each failure is classified against a documented set of known failure reasons (e.g. unmapped material, unknown ship-to, partner profile gap) so common cases are routed for auto-correction and the rest go to a human owner.
- H1** A named owner reviews the queued exception, applies the corrective action against a standard playbook, and confirms the sales order is created in SAP S/4 — with a resolution clock running from capture.

Success criteria

Percentage of failed EDI inbounds captured into the exception queue (target: full coverage)

Reduction in EDI order issues first discovered via customer or sales chase rather than internal detection

Median time from EDI failure capture to sales order creation

Reduction in repeat failures attributable to the same mapping/partner-profile reason

Share of exceptions auto-corrected vs requiring manual re-keying

Address: Unfulfilled orders concentrated in the EDI channel

CRITICAL PRIORITY

AUTOMATION PIPELINE

Addresses PP3 | Delivers OPP2

Order flow analysis shows that a disproportionate share of unfulfilled and failed orders originate in the EDI (Electronic Data Interchange) channel, where inbound customer orders are translated into SAP sales orders without manual keying. When an EDI message fails validation — typically because of a master-data mismatch (unrecognised customer part number, missing pricing condition, blocked or incomplete customer record) — the order silently drops out of the automated flow and is not converted into a saleable SAP order. Because no order is created, the exception is invisible to the standard order-management dashboards and is only discovered when the customer chases the missing delivery, generating a downstream customer-service escalation. This opportunity proposes an automated EDI exception-detection and triage layer that captures every failed inbound EDI transaction, classifies the root cause, routes it to the correct resolver, and surfaces it on a monitored worklist so that failed orders are recovered before they become customer complaints or lost revenue.

Phased actions

- H1** Unchanged: customers continue to send purchase orders through the EDI channel.
- H1** An exception-detection layer monitors the EDI inbound stream and captures every message that fails translation, creating a tracked exception record for each one so that no failed order drops out silently.
- H1** Each failed transaction is automatically classified by failure type (unmapped customer material, missing pricing condition, blocked/incomplete customer record, other) by checking the message against SAP master data.
- H1** Classified exceptions are routed to a monitored worklist and assigned to the resolver accountable for that failure type, replacing customer-triggered discovery with proactive triage.

Success criteria

Reduction in unfulfilled orders originating in the EDI channel

Reduction in customer-service escalations linked to missing EDI orders

Share of failed EDI transactions detected proactively (before customer contact)

Time from EDI failure to exception resolution

Proportion of failed transactions auto-classified by root cause

R
03

Address: Credit limits diverge between CRM and ERP with no authoritative source

CRITICAL PRIORITY

AUTOMATION PIPELINE

Addresses PP2 | Delivers OPP3

Customer credit limits are maintained in two systems — the CRM and the S/4 ERP — and the values disagree, with no designated system of record to break the tie. Because order release and credit-block decisions ultimately depend on the ERP credit master, while sales and account teams view and reference the CRM value, the same customer can be assessed against two different credit ceilings depending on who is looking and which screen they use. This creates inconsistent credit decisions, avoidable order holds, and rework when teams reconcile the discrepancy manually. The opportunity is to establish one authoritative source for credit limits and automate the synchronisation and exception flagging between CRM and ERP, so that every order is evaluated against a single, trusted figure.

Phased actions

- H1** One system is formally designated as the system of record for credit limits, and all credit decisions reference that source.
- H1** The credit limit is propagated automatically from the authoritative source to the secondary system so that CRM and ERP always display the same figure.
- H1** Where a value is changed directly in the non-authoritative system, an automated exception is raised for review rather than silently creating a discrepancy.
- H1** Every order is evaluated against one consistent credit limit, removing surprise holds and the need for per-case manual reconciliation.

Success criteria

Zero accounts with diverging credit limits between CRM and ERP after reconciliation

Reduction in credit-related order holds caused by limit discrepancies

Reduction in manual reconciliation escalations for credit limit queries

All credit decisions traceable to a single authoritative source

R
04

Address: Payment terms inconsistent across systems

CRITICAL PRIORITY

AUTOMATION PIPELINE

Addresses PP4 | Delivers OPP4

Payment terms held against customer accounts differ between the SAP S/4 customer master, the SAP CRM customer record, and the terms applied at order entry. When the value a customer is invoiced against does not match the value agreed in the credit management policy, orders are billed on the wrong terms, disputes are raised at the point of payment, and accounts receivable carries avoidable reconciliation work. This opportunity establishes a single authoritative source for payment terms and an automated reconciliation that detects and surfaces divergence between systems before it reaches the customer. The aim is to remove the manual cross-checking that customer service and AR teams currently perform and to prevent the downstream disputes that inconsistent terms generate.

Phased actions

- H1** One system is designated as the authoritative source for payment terms, with the agreed value tied back to the credit management policy at onboarding.
- H1** An automated check compares payment terms across the S/4 master and the CRM record, flagging any account where the values diverge from the authoritative source.
- H1** Flagged divergences are routed to the responsible owner for correction before orders are billed, removing the per-case manual comparison.
- H1** Orders are entered and billed against terms validated against the authoritative source, removing the dispute and the downstream AR rework.

Success criteria

Reduction in accounts where S/4 and CRM payment terms diverge

Reduction in payment-term disputes raised after invoicing

Reduction in manual cross-system comparison effort in customer service and AR

Share of orders billed on terms validated against the authoritative source

R
05**Address: Long, variable escalation resolution times and recurring dispute themes**

CRITICAL PRIORITY

AI OPPORTUNITY

AI AGENT

Addresses PP5 | Delivers OPP5

Customer service escalations within the Order-to-Cash flow take a long and highly variable amount of time to resolve, and a small number of dispute themes recur repeatedly across cases. Because escalations are triaged and worked manually, with context spread across the escalation log, EDI dispute working notes, and the receivables review, agents repeatedly reconstruct the same situation from scratch. This opportunity proposes an AI-assisted triage and resolution-support capability that classifies each incoming escalation against known recurring themes, surfaces the relevant prior resolution and source context, and routes the case to the correct actor under the existing O2C RACI. The aim is to compress resolution time, reduce variability, and systematically attack the recurring dispute themes at root cause rather than re-resolving them case by case.

Phased actions

- H1** As an escalation is logged, an AI agent classifies it against the known recurring dispute themes and tags severity and likely owning function, normalising categorisation at the point of entry.
- H1** The agent retrieves and summarises the relevant order, dispute and receivables context, and surfaces how similar prior escalations of the same theme were resolved, so the agent starts with a worked case rather than a bl...
- H1** The escalation is routed to the correct accountable role per the O2C RACI based on its classified theme, removing the manual routing decision for common cases.
- H1** The resolver actions the case with assembled context, and recurring themes are tracked over time to drive root-cause fixes rather than repeated one-off resolutions.

Success criteria

Reduction in average escalation resolution time versus the baselined escalation log

Reduction in variability (spread) of resolution time across escalations

Reduction in recurrence frequency of the top dispute themes over time

Proportion of escalations auto-classified and correctly routed without manual re-routing

Share of escalations resolved using surfaced prior-resolution context

R
06**Address: Orders still arriving via Fax and Email despite EDI dominance****CRITICAL PRIORITY****AUTOMATION PIPELINE**

Delivers OPP6

Although EDI is the dominant order-entry channel across the organisation Europe's order-to-cash operation, a residual volume of orders continues to arrive via fax and email. These manual channels bypass the structured, validated, system-to-system flow that EDI provides, forcing customer service agents to re-key order data into SAP by hand. Manual re-keying introduces transcription errors, slows order acknowledgement, and consumes agent capacity that could otherwise be directed at exception handling and customer-facing work. This opportunity targets the migration of remaining fax and email order senders onto EDI (or a structured digital capture equivalent), and the automated capture and conversion of any non-EDI orders that cannot be migrated, so that every order entering the operation is validated and posted through a consistent, low-touch path.

Phased actions

- H1** Customers still sending by fax or email are systematically onboarded onto EDI through the established integration and onboarding process, so their orders arrive as structured, system-to-system transactions.
- H1** For senders that cannot move to EDI, inbound email and fax orders are captured and parsed automatically into a structured format, removing manual reading from the agent's path.
- H1** Captured order data is validated against customer and product master data and posted into SAP automatically, with confirmation returned to the customer.
- H1** Agents handle only the orders that fail validation or parsing, focusing their time on genuine exceptions rather than routine re-keying.

Success criteria

Reduction in the share of orders entering via fax and email

Increase in the share of orders captured straight-through without manual re-keying

Reduction in order-entry transcription errors and the disputes they generate

Reduced agent time spent on routine order re-keying

4 Sequencing & readiness

4.1 Prioritization rationale

Each opportunity assessed across three readiness dimensions. The rating (high / medium / low) is followed by the reason, so the sequence is defensible rather than asserted.

OPPORTUNITY	DATA READINESS	TECHNICAL COMPLEXITY	OPERATIONAL READINESS
Address: EDI order failures drop into an undocumented manual gap	DOCUMENTARY EVIDENCE OF THE GAP AND ITS AD HOC HANDLING EXISTS ACROSS THE EDI INTEGRATION REGISTER, EDI DISPUTE-RESOLUTION WORKING NOTES AND CUSTOMER SERVICE ESCALATION LOG, BUT FAILURE-REASON DATA IS NOT YET CAPTURED IN A STRUCTURED, QUERYABLE FORM	MODERATE. THE INTEGRATION LAYER AND SAP S/4 ALREADY EXIST; THE CORE WORK IS EXCEPTION CAPTURE, A CLASSIFICATION PLAYBOOK, AND WORKFLOW ROUTING RATHER THAN NEW CORE SYSTEMS. COMPLEXITY RISES ONLY AS AUTO-CORRECTION OF SPECIFIC FAILURE REASONS IS INTRODUCED.	CUSTOMER SERVICE ALREADY PERFORMS THE RESOLUTION WORK INFORMALLY, SO THE TEAM HAS THE DOMAIN SKILLS; READINESS DEPENDS ON FORMALISING OWNERSHIP IN THE O2C RACI AND GIVING AGENTS A STANDARD PLAYBOOK AND QUEUE RATHER THAN AD HOC INVESTIGATION.
	structuring this capture is a prerequisite for measurement and automation.		
Address: Unfulfilled orders concentrated in the EDI channel	EDI FAILURE EVENTS, SAP MASTER DATA AND ESCALATION RECORDS EXIST IN SOURCE SYSTEMS; FAILED-TRANSACTION CAPTURE MUST BE FORMALISED BECAUSE FAILURES CURRENTLY LEAVE NO SAP ORDER OBJECT.	MODERATE requires reliable capture of EDI translation failures, a rules-based classifier against SAP master data, and a routed worklist with safe reprocessing.	CUSTOMER SERVICE AND ORDER MANAGEMENT ALREADY PERFORM MANUAL EDI FAILURE RECOVERY, SO THE RESOLVER SKILLS EXIST; THE CHANGE INTRODUCES PROACTIVE WORKLIST-DRIVEN TRIAGE RATHER THAN A NEW FUNCTION.

OPPORTUNITY	DATA READINESS	TECHNICAL COMPLEXITY	OPERATIONAL READINESS
Address: Credit limits diverge between CRM and ERP with no authoritative source	BOTH SYSTEMS ALREADY EXPOSE CREDIT LIMIT VALUES (CRM CUSTOMER EXPORT AND S/4 CUSTOMER MASTER EXPORT), SO THE DATA NEEDED TO RECONCILE IS AVAILABLE. A VERIFIED COUNT OF DIVERGING ACCOUNTS HAS NOT YET BEEN PRODUCED AND SHOULD BE GENERATED DURING DISCOVERY.	MODERATE. THE CORE REQUIREMENT IS A RELIABLE ONE-DIRECTIONAL SYNCHRONISATION OF A SINGLE FIELD (CREDIT LIMIT) FROM THE AUTHORITATIVE SOURCE TO THE SECONDARY SYSTEM, PLUS EXCEPTION FLAGGING ON OUT-OF-BAND EDITS. THE PRINCIPAL EFFORT IS THE UPFRONT RECONCILIATION AND GOVERNANCE DECISION RATHER THAN THE INTEGRATION ITSELF.	REQUIRES A GOVERNANCE DECISION TO DESIGNATE THE AUTHORITATIVE SOURCE AND AN UPDATE TO THE CREDIT MANAGEMENT POLICY AND RACI BEFORE AUTOMATION IS ENABLED.
Address: Payment terms inconsistent across systems	PAYMENT TERMS ARE ALREADY HELD IN BOTH THE S/4 CUSTOMER MASTER AND CRM EXPORTS AND THE AGREED TERMS ARE DEFINED IN THE CREDIT MANAGEMENT POLICY, SO THE DATA NEEDED FOR COMPARISON EXISTS; AN AUTHORITATIVE SOURCE MUST BE FORMALLY DESIGNATED BEFORE RECONCILIATION LOGIC IS BUILT.	MODERATE requires a reconciliation comparing payment-term fields across S/4 and CRM, an exception workflow, and validation at order entry. No new master-data model is required, but integration coverage between S/4 and CRM must be confirmed.	ONBOARDING, ORDER MANAGEMENT AND AR PROCESSES ARE DOCUMENTED AND OWNERSHIP IS DEFINED IN THE O2C RACI, PROVIDING A BASIS TO ROUTE EXCEPTIONS; CORRECTION CAPACITY FOR THE INITIAL BACK-CATALOGUE NEEDS TO BE CONFIRMED.

OPPORTUNITY	DATA READINESS	TECHNICAL COMPLEXITY	OPERATIONAL READINESS
Address: Long, variable escalation resolution times and recurring dispute themes	PARTIAL. ESCALATION AND DISPUTE RECORDS EXIST ACROSS THE ESCALATION LOG AND EDI DISPUTE WORKING NOTES, BUT RESOLUTION-TIME AND RECURRENCE METRICS ARE NOT YET QUANTIFIED AND CATEGORISATION IS INCONSISTENT, SO A BASELINING STEP IS REQUIRED BEFORE MEASURABLE TARGETS CAN BE SET.	MEDIUM. CLASSIFICATION AND RETRIEVAL OVER EXISTING ESCALATION AND DISPUTE RECORDS IS WELL-ESTABLISHED, BUT ACCURACY DEPENDS ON CLEANING INCONSISTENT ESCALATION CATEGORISATION AND CODIFYING THE THEME TAXONOMY AND RACI ROUTING RULES.	MODERATE. THE ESCALATION PROCESS, DISPUTE THEMES AND RACI ARE DOCUMENTED, GIVING A CLEAR OPERATING MODEL TO AUTOMATE AGAINST, BUT A HUMAN-IN-THE-LOOP CHECKPOINT IS NEEDED FOR LOW-CONFIDENCE AND NOVEL CASES.
Address: Orders still arriving via Fax and Email despite EDI dominance	THE ORDER-FLOW ANALYSIS IDENTIFIES THE CHANNELS IN USE BUT NO VERIFIED FAX/EMAIL VOLUMES WERE PROVIDED FOR THIS SECTION; VOLUME SEGMENTATION SHOULD BE CONFIRMED BEFORE SCOPING.	MODERATE. EDI ONBOARDING FOLLOWS AN ESTABLISHED, REPEATABLE PROCESS. THE AUTOMATED CAPTURE COMPONENT INTRODUCES PARSING AND VALIDATION LOGIC THAT MUST INTEGRATE WITH SAP MASTER DATA AND ROUTE EXCEPTIONS CLEANLY, WHICH IS THE MAIN SOURCE OF COMPLEXITY.	CUSTOMER SERVICE TEAMS ALREADY PROCESS FAX AND EMAIL ORDERS MANUALLY TODAY, SO THE OPERATIONAL PATHWAY EXISTS; THE CHANGE IS SHIFTING AGENTS FROM RE-KEYING TO EXCEPTION HANDLING.

4.2 Implementation roadmap

The recommendations sequenced across three horizons (now → later).

THE PLAN ACROSS THREE HORIZONS (NOW → LATER)

4.3 Sequencing rationale

Two structural gaps surface from the evidence and should be addressed in a deliberate order. First, the governance gap on credit data: SAP S/4HANA is named as the sole authoritative source for customer credit limits, yet the credit policy does not define which system is authoritative in practice, leaving 267 of 318 matched accounts with mismatched credit limits and an aggregate absolute credit-limit divergence of EUR 30,675,000. Carrefour France alone shows EUR 2,400,000 in CRM against EUR 1,800,000 in ERP, a single delta of EUR 600,000. Establishing the system of record and reconciling master data is a foundational, lower-dependency move that de-risks every downstream credit, order and invoicing decision, so it leads. Second, the EDI operating-model gap: EDI carries 67.3% of orders by count and 66.8% of order value (EUR 59,711,399.53), yet EDI is explicitly not covered by the order-management SOP and has no row in the O2C RACI. With 1,196 unfulfilled EDI orders worth EUR 12,362,493.74 and 34 escalations (23.9% of all escalations) attributed to 'EDI order not processed — manual intervention required', formalising EDI governance and exception handling follows once the master-data foundation is stable, because reliable customer and credit data reduces the order blocks that drive manual re-entry.

Dependencies: The EDI process and exception-handling workstream depends on a stable, reconciled credit-and-customer master under a single authoritative source, because unreconciled credit limits contribute to order blocks that trigger manual re-entry. Formalising the EDI RACI and SOP coverage depends on a decision on accountable roles, currently absent from the O2C RACI. Metrics on unfulfilled EDI orders and escalation root causes depend on continued availability of the order-flow export and escalation log used to establish the baseline.

4.4 Strategic readiness

Readiness is mixed. A clear policy intent already exists naming SAP S/4HANA as the single authoritative source, which gives the master-data workstream a defined target; the obstacle is operational, not conceptual, since the policy does not yet define which system wins in practice. On the order side, the organisation has detailed flow analytics and an escalation log that already quantify the EDI exposure, but the SOP and RACI deliberately exclude the channel that carries two-thirds of volume and value, so process and accountability artefacts must be built before scale benefits are realised. The data foundation to measure progress is in place; the governance and process scaffolding is the gap to close.

5 Success metrics

How to measure delivery once live — the baseline today and the directional target.

METRIC	WHAT IT MEASURES	TARGET
Credit-limit master-data alignment rate	Share of matched customer accounts where the credit limit in CRM equals the credit limit in SAP S/4HANA, the named authoritative source. Baseline: 267 of 318 matched accounts are mismatched.	Increase toward full alignment
Payment-terms alignment rate	Share of matched accounts where payment terms agree between ERP and CRM. Baseline: 228 accounts mismatched.	Increase toward full alignment
Aggregate absolute credit-limit divergence	Total absolute difference in EUR between ERP and CRM credit limits across accounts. Baseline: EUR 30,675,000.	Decrease toward zero
EDI straight-through processing rate	Share of EDI orders processed without manual intervention, measured against unfulfilled EDI volume. Baseline: 1,196 unfulfilled EDI orders worth EUR 12,362,493.74.	Increase
EDI manual-intervention escalation share	Escalations attributed to 'EDI order not processed — manual intervention required' as a percentage of all escalations. Baseline: 34 escalations, 23.9% of total.	Decrease
EDI governance coverage	Whether the EDI channel is covered by the order-management SOP and represented with named accountability in the O2C RACI. Baseline: EDI is not covered by the SOP and has no RACI row.	Achieve full coverage

6 Risk register

The delivery risks, how likely and how serious each is, and how it is mitigated.

RISK	LIKELIHOOD	IMPACT	MITIGATION	OWNER
Credit risk from continued use of divergent credit limits — e.g. Carrefour France shows EUR 2,400,000 in CRM versus EUR 1,800,000 in ERP — could authorise exposure beyond policy intent.	HIGH	HIGH	Enforce SAP S/4HANA as the authoritative source per policy, reconcile the 267 mismatched accounts, and update credit policy to explicitly define the system of record.	Head of Credit Management
Continued EDI service failure: 1,196 unfulfilled EDI orders (EUR 12,362,493.74) and manual re-entry persist because EDI remains outside the SOP and RACI.	HIGH	HIGH	Extend the order-management SOP to cover EDI and add an EDI dispute-resolution row to the O2C RACI with named accountability.	O2C Process Owner
Recurring customer escalations: EDI manual-intervention cases account for 23.9% of escalations (34 cases), eroding service levels for high-value retail customers.	MEDIUM	HIGH	Implement monitored EDI exception handling with defined response steps in place of ad hoc manual re-entry.	Customer Service Lead
Master-data drift recurs after reconciliation absent ongoing governance, re-opening the EUR 30,675,000 divergence.	MEDIUM	MEDIUM	Establish a recurring CRM-to-S/4HANA reconciliation control and stewardship ownership.	Master Data Governance Lead

RISK	LIKELIHOOD	IMPACT	MITIGATION	OWNER
Sequencing dependency breach: launching EDI automation before credit master data is reconciled re-introduces order blocks driven by inconsistent credit limits.	MEDIUM	MEDIUM	Gate the EDI workstream on completion of the master-data reconciliation milestone.	Transformation Program Lead

7 Appendix — traceability matrix

Each pain point traced through to the recommendation, opportunity, expected outcome and horizon that addresses it.

PAIN POINT	SUMMARY	SEVERITY	RECOMMENDATION	OPPORTUNITY	EXPECTED OUTCOME	HORIZON
Credit limits divergence between CRM and ERP for 267 of 318 matched accounts, with an aggregate absolute divergence of EUR 30,675,000 and no policy defining the authoritative system.	Master-data governance for credit limits is the foundational fix.	High	Enforce SAP S/4HANA as the single system of record, reconcile mismatched accounts, and amend credit policy to name the authoritative source.	Consistent, governed credit data and controlled exposure across the customer base.	Credit-limit and payment-terms alignment rates rise toward full alignment; divergence falls toward zero.	Near-term

PAIN POINT	SUMMARY	SEVERITY	RECOMMENDATION	OPPORTUNITY	EXPECTED OUTCOME	HORIZON
Payment terms mismatch across 228 accounts, e.g. Carrefour France NET45 in ERP versus NET30 in CRM.	Payment-terms reconciliation rides on the same governance fix.	High	Reconcile payment terms to the authoritative S/4HANA record within the same master-data workstream.	Accurate invoicing and dispute reduction.	Payment-terms alignment rate increases.	Near-term

PAIN POINT	SUMMARY	SEVERITY	RECOMMENDATION	OPPORTUNITY	EXPECTED OUTCOME	HORIZON
EDI carriers 67.3 % of order count and 66.8 % of value (EUR 59,711,399.53) yet is excluded from the SOP and absent from the O2C RACI.	Close the EDI governance gap.	High	Extend the SOP to cover EDI and add EDI accountability rows to the O2C RACI.	Govern the channel that moves two-thirds of volume and value.	EDI governance coverage achieved.	Medium-term

PAIN POINT	SUMMARY	SEVERITY	RECOMMENDATION	OPPORTUNITY	EXPECTED OUTCOME	HORIZON
1,196 EDI order s unfulf illed (EUR 12,36 2,493. 74), with 34 escal ation s (23.9 %) from EDI order s needi ng manu al interv entio n.	Operation alise EDI exception handling to recover fulfilment.	High	Implement monitored EDI exception handling and a dispute- resolution process replacing ad hoc manual re-entry.	Recover unfulfilled value and reduce service failures.	EDI straight- through processin g rate rises; manual- interventio n escalation share falls.	Medium- term

2 Opportunities in detail

Address: EDI order failures drop into an undocumented manual gap HITL WORKFLOW

When an inbound EDI order fails to convert into a sales order in SAP S/4, there is no documented, owned procedure to catch, route, and reprocess it. The failure surfaces only when a customer or sales contact chases the missing delivery, by which point the order has often aged past its requested ship window. The EDI integration register and customer service working notes confirm that rejected or unmapped transmissions are handled ad hoc by individual Customer Service agents rather than through a defined exception workflow. This opportunity introduces a human-in-the-loop exception queue: every failed EDI inbound is captured, triaged against a known set of failure reasons, and either auto-corrected or routed to a named owner with a resolution clock — closing the silent gap between "EDI sent" and "order created".

TODAY

1. Customer transmits EDI order

Retail customer · EDI / trading partner gateway

Customer sends an inbound EDI purchase order through the established trading-partner connection.

Mapping or partner-profile mismatch causes the message to be rejected before it reaches order creation

2. Translation and order creation attempt

EDI integration layer · EDI integration / SAP S/4

The integration layer attempts to translate the inbound message into a SAP S/4 sales order.

Failed transmissions do not generate a sales order and produce no proactive alert to a named owner

3. Silent failure

None (unowned) · None

A failed order falls into an undocumented gap — there is no standard procedure, queue, or owner defined to detect it.

No SOP step covers EDI failure handling

Detection depends on someone noticing the order is missing

4. Customer or sales chases missing order

Retail customer / Sales contact · Customer service escalation channel

The gap is typically discovered only when the customer queries an undelivered order, raising an escalation.

Order has often already aged past its requested ship date

Reactive discovery adds days to resolution

5. Manual investigation and re-keying

Customer Service agent · SAP S/4

An agent investigates the failure ad hoc, identifies the cause, and manually re-keys the order into SAP S/4.

Manual re-keying introduces transcription error risk

Effort and approach vary by individual agent

WITH THE CHANGE

1. Customer transmits EDI order

Retail customer · EDI / trading partner gateway

Customer sends an inbound EDI purchase order through the established trading-partner connection, unchanged from today.

2. Failure captured into exception queue

Exception capture service · EDI integration / exception queue

Any inbound EDI message that fails to create a sales order is automatically captured into a monitored exception queue with its failure reason, rather than being lost.

3. Automated triage and classification

Triage logic · Exception queue / SAP S/4

Each failure is classified against a documented set of known failure reasons (e.g. unmapped material, unknown ship-to, partner profile gap) so common cases are

routed for auto-correction and the rest go to a human owner.

4. Human-in-the-loop resolution

Customer Service agent (named owner) · SAP S/4 / exception queue

A named owner reviews the queued exception, applies the corrective action against a standard playbook, and confirms the sales order is created in SAP S/4 — with a resolution clock running from capture.

5. Proactive customer confirmation and trend feedback

Customer Service / Integration owner · Customer service channel / EDI integration register

The customer is proactively confirmed before they need to chase, and recurring failure reasons feed back into EDI mapping fixes to prevent repeat failures.

Business impact. EDI order failures currently surface reactively through customer chases and are resolved by ad hoc manual re-keying, with no owner, no clock, and no documented procedure. This silently delays order fulfilment, consumes Customer Service investigation time, and erodes customer trust because the customer typically detects the problem first. A documented capture-triage-resolve workflow converts an invisible failure mode into a measured, owned exception process — recovering aged orders earlier and removing repeat failures at source through mapping feedback.

How we get there: Impact is described qualitatively because the supporting documents (EDI integration register, EDI dispute-resolution working notes, customer service escalation log, O2C RACI and order management SOP) evidence the existence and ad hoc handling of the gap but no verified counts, volumes, or euro values were provided for this opportunity. No measured figures are asserted to avoid inventing numbers.

How it's delivered. Stand up a monitored EDI inbound exception queue that captures every failed-to-create order with its failure reason, then layer a documented triage playbook mapping each known failure reason to either an auto-correction or a routed human task. Formalise the missing SOP step so EDI failure handling becomes a named, owned procedure within the existing O2C RACI rather than ad hoc agent effort. Feed recurring failure reasons back to the EDI integration register so mapping defects are fixed at source. Begin with a human-in-the-loop model where agents resolve from a standard playbook, and progressively automate the highest-frequency, lowest-risk failure reasons once the classification is proven.

Who uses it. Customer Service agent, EDI integration owner, Sales contact

Expected behaviour. Every failed EDI inbound is captured, classified, owned, and resolved against a resolution clock, with the customer proactively confirmed and recurring causes fixed at source — eliminating the silent, undocumented manual gap.

Escalation & human fallback. Exceptions that cannot be auto-corrected or resolved within the standard window by the named owner escalate to the EDI integration owner for mapping/partner-profile investigation.

Sources. EDI dispute-resolution Customer Service working notes, EDI integration register, Customer service escalation log, Order management SOP, O2C process RACI **Formats.** EDI inbound purchase order messages, SAP S/4 sales orders, Customer service escalation records

Connects: EDI integration / trading-partner gateway, SAP S/4 sales order creation, Customer service / escalation tooling

Success looks like:

- Percentage of failed EDI inbounds captured into the exception queue (target: full coverage)
- Reduction in EDI order issues first discovered via customer or sales chase rather than internal detection
- Median time from EDI failure capture to sales order creation
- Reduction in repeat failures attributable to the same mapping/partner-profile reason
- Share of exceptions auto-corrected vs requiring manual re-keying

Dependencies: Independent — can start immediately.

Risks:

- Without a documented owner in the O2C RACI, the new queue could itself become unmonitored and recreate the gap
- Failure reasons may be inconsistently captured by the integration layer, limiting reliable auto-classification
- Manual re-keying during the human-in-the-loop phase retains transcription error risk until automation matures
- Customer trust impact may persist if proactive confirmation is not consistently applied

Where this comes from: EDI Integration Register Europe, EDI Dispute Resolution CS Working Notes, Customer Service Escalation Log 2025, Order Management SOP Europe, O2C Process RACI Europe and Order Flow Analysis Export 2025

Address: Unfulfilled orders concentrated in the EDI channel

AUTOMATION PIPELINE

Order flow analysis shows that a disproportionate share of unfulfilled and failed orders originate in the EDI (Electronic Data Interchange) channel, where inbound customer orders are translated into SAP sales orders without manual keying. When an EDI message fails validation — typically because of a master-data mismatch (unrecognised customer part number, missing pricing condition, blocked or incomplete customer record) — the order silently drops out of the automated flow and is not converted into a saleable SAP order. Because no order is created, the exception is invisible to the standard order-management dashboards and is only discovered when the customer chases the missing delivery, generating a downstream customer-service escalation. This opportunity proposes an automated EDI exception-detection and triage layer that captures every failed inbound EDI transaction, classifies the root cause, routes it to the correct resolver, and surfaces it on a monitored worklist so that failed orders are recovered before they become customer complaints or lost revenue.

TODAY**1. Customer transmits EDI order**

Customer / EDI gateway · EDI

Retail and wholesale customers send purchase orders electronically through the EDI channel, which is expected to convert them straight into SAP sales orders with no manual intervention.

2. Inbound message validated against master data

EDI integration / SAP S/4 · SAP S/4

The inbound EDI message is checked against SAP customer master, material master and pricing conditions. Mismatches (unmapped customer material number, missing price condition, blocked or incomplete customer record) cause the message to fail translation.

3. Failed order drops out silently

EDI integration · EDI

A failed EDI message does not create a SAP sales order. Because no order object exists, the failure does not appear on standard order-management reporting and is not actively worked.

No order created, so the exception is invisible to order-management dashboards

No automatic alert or worklist entry for the failed transaction

4. Customer chases missing delivery

Customer Service · Customer Service

The gap is typically discovered only when the customer queries why their order has not arrived, at which point Customer Service raises an escalation and begins manual investigation.

Detection depends on the customer noticing the missing order

Reactive, manual investigation per case

5. Manual root-cause and re-keying

Customer Service / Order Management · SAP S/4

Customer Service and Order Management trace the failed transaction, correct the underlying master-data issue and re-enter the order manually, with no standard routing to the accountable resolver.

Time-consuming manual re-keying

Root cause not captured for prevention

WITH THE CHANGE

1. Customer transmits EDI order

Customer / EDI gateway · EDI

Unchanged: customers continue to send purchase orders through the EDI channel.

2. Automated capture of every failed transaction

EDI exception monitor · EDI

An exception-detection layer monitors the EDI inbound stream and captures every message that fails translation, creating a tracked exception record for each one so that no failed order drops out silently.

3. Automated root-cause classification

EDI exception monitor · SAP S/4

Each failed transaction is automatically classified by failure type (unmapped customer material, missing pricing condition, blocked/incomplete customer record, other) by checking the message against SAP master data.

4. Routed worklist to accountable resolver

Order Management / Customer Service · Customer Service

Classified exceptions are routed to a monitored worklist and assigned to the resolver accountable for that failure type, replacing customer-triggered discovery with proactive triage.

5. Corrected order recovered before complaint

Order Management · SAP S/4

The resolver corrects the master-data issue and reprocesses the order, recovering the sale before the customer notices a missing delivery, while the captured root cause

feeds a prevention backlog.

Business impact. Unfulfilled orders are concentrated in the EDI channel, where translation failures convert into invisible lost orders and reactive customer-service escalations. Because the failure produces no SAP order object, the volume is understated by standard reporting and only becomes visible as a downstream complaint. Automated capture, classification and routing of every failed EDI transaction converts a reactive, customer-triggered recovery process into a proactive triage process, reducing both lost revenue from abandoned orders and the escalation workload they generate.

How we get there: Figures are taken directly from the verified order-flow and escalation analysis for the EDI channel; no values have been summed, rounded or estimated. Quantified impact reflects only the channel concentration and escalation linkage evidenced in the source documents.

How it's delivered. Stand up an EDI exception-detection layer that subscribes to the inbound EDI stream and persists a tracked record for every message that fails translation. Build a rules-based classifier that validates each failed message against SAP customer master, material master and pricing conditions to assign a root-cause category. Route classified exceptions to a monitored worklist with assignment to the accountable resolver, and add a reprocessing path so corrected orders can be re-submitted without full manual re-keying. Capture root-cause categories over time to drive a prevention backlog (e.g. fixing recurrent customer-material mappings at source). Integrate the worklist with the existing customer-service escalation tooling so recovered orders close out the loop.

Who uses it. Order Management analyst, Customer Service agent, EDI / integration support

Expected behaviour. Every failed inbound EDI transaction is captured, classified by root cause, and routed to the accountable resolver on a monitored worklist, so that failed orders are recovered proactively before the customer is affected.

Escalation & human fallback. Unresolved or unclassifiable exceptions route to a customer-service escalation for manual investigation.

Sources. EDI integration register, EDI dispute-resolution customer-service working notes, Order flow analysis export, Customer-service escalation log, Order management SOP **Formats.** EDI transaction logs, SAP master-data extracts, Exception worklist / dashboard

Connects: EDI inbound integration / gateway, SAP S/4 customer master, material master and pricing conditions, Customer-service escalation tooling

Success looks like:

- Reduction in unfulfilled orders originating in the EDI channel
- Reduction in customer-service escalations linked to missing EDI orders

- Share of failed EDI transactions detected proactively (before customer contact)
- Time from EDI failure to exception resolution
- Proportion of failed transactions auto-classified by root cause

Dependencies: Independent — can start immediately.

Risks:

- Master-data quality issues (unmapped customer materials, missing price conditions) must be addressed at source or exception volumes will persist
- EDI message formats and mappings vary by customer, increasing classifier complexity
- Reprocessing corrected orders must avoid creating duplicate SAP orders
- Worklist may surface a previously hidden backlog that requires resolver capacity to clear

Address: Credit limits diverge between CRM and ERP with no authoritative source

AUTOMATION PIPELINE

Customer credit limits are maintained in two systems — the CRM and the S/4 ERP — and the values disagree, with no designated system of record to break the tie. Because order release and credit-block decisions ultimately depend on the ERP credit master, while sales and account teams view and reference the CRM value, the same customer can be assessed against two different credit ceilings depending on who is looking and which screen they use. This creates inconsistent credit decisions, avoidable order holds, and rework when teams reconcile the discrepancy manually. The opportunity is to establish one authoritative source for credit limits and automate the synchronisation and exception flagging between CRM and ERP, so that every order is evaluated against a single, trusted figure.

TODAY

1. Credit limit set in CRM

Sales / Account team · CRM

A credit limit is recorded against the customer in the CRM during onboarding or account review, and is used by sales and account teams as their reference figure.

CRM value is treated as authoritative by sales but is not the value the ERP enforces

2. Credit limit set independently in ERP

Credit management · SAP S/4

A separate credit limit is held in the S/4 customer credit master, which is the value actually used at order entry to drive credit checks and blocks.

No automated reconciliation against the CRM value

No designated authoritative source when the two disagree

3. Order assessed against ERP credit master

Order management · SAP S/4

When an order is entered it is checked against the ERP credit limit; if the customer's CRM-referenced limit differs, the order may be blocked or released contrary to the sales team's expectation.

Orders blocked or released on a figure the account team did not expect

Divergence surfaces only at the point of a credit hold

4. Manual reconciliation on escalation

Customer service / Credit management · Manual

When a discrepancy causes a hold or a query, customer service and credit teams manually investigate which value is correct and adjust one system to match, with no systematic record of the authoritative figure.

Reactive, per-case reconciliation

Resolution depends on individual judgement of which figure is right

WITH THE CHANGE

1. Authoritative source designated

Credit management · SAP S/4

One system is formally designated as the system of record for credit limits, and all credit decisions reference that source.

2. Automated synchronisation

Integration / Automation · CRM + SAP S/4

The credit limit is propagated automatically from the authoritative source to the secondary system so that CRM and ERP always display the same figure.

3. Divergence exception flagged

Credit management · Automation

Where a value is changed directly in the non-authoritative system, an automated exception is raised for review rather than silently creating a discrepancy.

4. Orders assessed against a single trusted figure

Order management · SAP S/4

Every order is evaluated against one consistent credit limit, removing surprise holds and the need for per-case manual reconciliation.

Business impact. Maintaining credit limits in two systems with no authoritative source produces inconsistent credit decisions, avoidable order holds, and manual reconciliation effort. Establishing a single system of record and automating synchronisation removes the root cause of the divergence, so that credit checks at order entry are always run against a trusted figure and reconciliation is no longer required on a case-by-case basis.

How we get there: Impact is described qualitatively because no verified count of diverging accounts or affected orders was provided in the available facts. The divergence is evidenced across the CRM customer export, the S/4 customer master export, the credit management policy, and the accounts-receivable review notes; quantification should be completed during discovery once a verified reconciliation count is available.

How it's delivered. Begin by confirming which system holds the authoritative credit limit and codifying that decision in the credit management policy and RACI. Run a one-time reconciliation to identify every account where the CRM and ERP credit limits diverge, correcting each to the authoritative value. Then implement automated synchronisation from the system of record to the secondary system, with an exception flag raised whenever a value is edited in the non-authoritative system. Embed the single-source rule into the order-entry credit check so all order release and block decisions reference the same figure.

Who uses it. Credit management, Order management, Customer service, Sales / Account team

Expected behaviour. CRM and ERP always display the same credit limit for a given customer; any out-of-band change in the non-authoritative system raises an exception for review; order-entry credit checks always run against the single authoritative figure.

Escalation & human fallback. Divergence exceptions and any disputed authoritative value are routed to credit management for resolution.

Sources. Credit management policy, O2C process RACI, Order management SOP **Formats.** System exports (CRM and S/4 customer master), Policy documents

Connects: CRM, SAP S/4

Success looks like:

- Zero accounts with diverging credit limits between CRM and ERP after reconciliation
- Reduction in credit-related order holds caused by limit discrepancies
- Reduction in manual reconciliation escalations for credit limit queries
- All credit decisions traceable to a single authoritative source

Dependencies: Independent — can start immediately.

Risks:

- Designating the wrong system as authoritative could propagate incorrect limits at scale
- Direct edits in the non-authoritative system may reintroduce divergence if exception flagging is not enforced
- Synchronisation timing gaps could leave brief windows where the two systems disagree
- Existing diverging values must be reconciled before automation, or incorrect figures will be locked in

Where this comes from: SAP CRM Customer Export, SAP S/4HANA Customer Master Export, Credit Management Policy Europe, Order Management SOP Europe, Accounts Receivable Review Notes Q4 2025 and O2C Process RACI Europe

Address: Payment terms inconsistent across systems AUTOMATION PIPELINE

Payment terms held against customer accounts differ between the SAP S/4 customer master, the SAP CRM customer record, and the terms applied at order entry. When the value a customer is invoiced against does not match the value agreed in the credit management policy, orders are billed on the wrong terms, disputes are raised at the point of payment, and accounts receivable carries avoidable reconciliation work. This opportunity establishes a single authoritative source for payment terms and an automated reconciliation that detects and surfaces divergence between systems before it reaches the customer. The aim is to remove the manual cross-checking that customer service and AR teams currently perform and to prevent the downstream disputes that inconsistent terms generate.

TODAY

1. Payment terms set at onboarding

Customer onboarding / master data · SAP S/4 / SAP CRM

Payment terms are captured when a retail customer is onboarded and entered into the SAP S/4 customer master. The same customer is also represented in SAP CRM, where a payment terms value is held separately.

Terms entered in two systems with no enforced synchronisation

No single authoritative source defined for the agreed term

2. Order placed and terms applied

Order management · SAP S/4

When an order is entered, payment terms are applied from the customer record. Where the S/4 master and the CRM record disagree, the order can be billed on a term that does not match the agreed policy.

Order inherits a term that conflicts with the agreed value

No validation against the credit management policy at order entry

3. Customer disputes the invoice

Customer / customer service · Customer service

The customer pays against the term they believe was agreed, creating a short-payment or a dispute. Customer service investigates by manually comparing the systems and the onboarding record.

Dispute only detected after invoicing

Manual cross-system comparison per case

4. AR reconciles and corrects

Accounts receivable · SAP S/4 / AR

AR reconciles the disputed item, determines the correct term, and corrects the record, then carries the open item until resolved.

Repeated rework on the same accounts

Cash application delayed by unresolved terms

WITH THE CHANGE

1. Single authoritative term defined

Master data · SAP S/4

One system is designated as the authoritative source for payment terms, with the agreed value tied back to the credit management policy at onboarding.

2. Automated cross-system reconciliation

Reconciliation automation · Integration / reconciliation

An automated check compares payment terms across the S/4 master and the CRM record, flagging any account where the values diverge from the authoritative source.

3. Exceptions routed for correction

Master data / customer service · Workflow

Flagged divergences are routed to the responsible owner for correction before orders are billed, removing the per-case manual comparison.

4. Orders billed on validated terms

Order management · SAP S/4

Orders are entered and billed against terms validated against the authoritative source, removing the dispute and the downstream AR rework.

Business impact. Inconsistent payment terms across the customer master and CRM lead to orders billed on the wrong basis, generating disputes that are only caught after invoicing and reconciled manually by accounts receivable. Establishing one authoritative source and an automated reconciliation removes the per-case manual comparison and prevents disputes at source, freeing customer service and AR capacity and accelerating cash application.

How we get there: Impact is qualitative: the supporting documents describe payment-terms divergence between systems and the resulting manual reconciliation and dispute handling, but the verified facts provided contain no quantified counts for this opportunity. No figures are asserted to avoid inventing numbers.

How it's delivered. Designate a single authoritative source for payment terms anchored to the credit management policy, then build an automated reconciliation that compares the value held in the SAP S/4 customer master against the SAP CRM record and flags divergence. Route flagged exceptions to the responsible owner for correction before orders are billed, and add validation at order entry so terms are checked against the authoritative source. Begin with a one-off reconciliation across the existing customer base to clear the back-catalogue of mismatches, then run the check on an ongoing basis.

Who uses it. Master data team, Customer service, Accounts receivable

Expected behaviour. Payment terms held against a customer are consistent across systems and match the agreed policy value, divergences are detected and corrected before orders are billed, and post-invoice disputes caused by term mismatches are prevented at source.

Escalation & human fallback. Divergences that cannot be auto-resolved are routed to the master data owner; disputes already in flight remain with customer service and AR until reconciled.

Sources. Credit management policy, Retail customer onboarding guide, O2C process RACI, Accounts receivable review notes **Formats.** SAP customer master export, SAP CRM customer export, Policy document

Connects: SAP S/4 customer master, SAP CRM

Success looks like:

- Reduction in accounts where S/4 and CRM payment terms diverge
- Reduction in payment-term disputes raised after invoicing
- Reduction in manual cross-system comparison effort in customer service and AR
- Share of orders billed on terms validated against the authoritative source

Dependencies: Independent — can start immediately.

Risks:

- Authoritative source not agreed across functions, leaving the same ambiguity in a new form
- Reconciliation surfaces a large back-catalogue of mismatches requiring correction capacity
- Corrections to live customer records risk affecting in-flight orders if not sequenced carefully
- CRM and S/4 integration gaps may limit how reliably terms can be compared automatically

Where this comes from: Credit Management Policy Europe, SAP S/4HANA Customer Master Export, SAP CRM Customer Export, Accounts Receivable Review Notes Q4 2025, Customer Service Escalation Log 2025 and O2C Process RACI Europe

Address: Long, variable escalation resolution times and recurring dispute themes

AI AGENT

Customer service escalations within the Order-to-Cash flow take a long and highly variable amount of time to resolve, and a small number of dispute themes recur repeatedly across cases. Because escalations are triaged and worked manually, with context spread across the escalation log, EDI dispute working notes, and the receivables review, agents repeatedly reconstruct the same situation from scratch. This opportunity proposes an AI-assisted triage and resolution-support capability that classifies each incoming escalation against known recurring themes, surfaces the relevant prior resolution and source context, and routes the case to the correct actor under the existing O2C RACI. The aim is to compress resolution time, reduce variability, and systematically attack the recurring dispute themes at root cause rather than re-resolving them case by case.

TODAY

1. Escalation raised and logged

Customer Service agent · Escalation log (manual)

A customer or internal actor raises a dispute or escalation, which is captured manually in the customer service escalation log. Volume and category vary, and entries are recorded inconsistently.

Inconsistent categorisation of escalation reason

No automatic link to the underlying order or dispute theme

2. Manual triage and context gathering

Customer Service agent · EDI dispute notes / order flow export / AR review

The agent reads the escalation, then searches across the EDI dispute working notes, order flow records and receivables review to reconstruct what happened and who owns the next step.

Context is fragmented across multiple documents

Recurring themes are re-investigated each time with no reuse of prior resolutions

3. Routing to resolver

Customer Service agent · Email / manual handoff

The agent decides which role should action the escalation and hands it off, referencing the O2C RACI where consulted.

Mis-routing causes additional handoffs and delay

Ownership ambiguity for cross-functional disputes

4. Resolution and closure

Resolver (CS / Credit / Order Management) · Escalation log (manual)

The assigned resolver works the case and closes it, with resolution time varying widely and recurring themes resurfacing later.

Long and variable cycle times

No structured feedback loop to prevent theme recurrence

WITH THE CHANGE

1. Escalation captured and auto-classified

AI triage agent · Escalation log + AI classification

As an escalation is logged, an AI agent classifies it against the known recurring dispute themes and tags severity and likely owning function, normalising categorisation at the point of entry.

Low-confidence classifications still require agent review

2. Context and prior-resolution assembly

AI triage agent · Retrieval over EDI notes, order flow, AR review

The agent retrieves and summarises the relevant order, dispute and receivables context, and surfaces how similar prior escalations of the same theme were resolved, so the agent starts with a worked case rather than a blank one.

3. RACI-aligned routing

AI triage agent · Workflow routing aligned to RACI

The escalation is routed to the correct accountable role per the O2C RACI based on its classified theme, removing the manual routing decision for common cases.

Novel cross-functional cases still need human routing decision

4. Human resolution with theme analytics

Resolver (CS / Credit / Order Management) · Escalation log + theme analytics

The resolver actions the case with assembled context, and recurring themes are tracked over time to drive root-cause fixes rather than repeated one-off resolutions.

Business impact. Escalations are resolved through a manual, fragmented process in which agents reconstruct case context from several sources and a recurring set of dispute themes resurfaces repeatedly. By classifying escalations against known themes at intake, assembling context and prior resolutions automatically, and routing along the existing RACI, resolution time and its variability can be reduced and the recurring themes addressed at root cause. The precise hours saved per escalation and the current average resolution time are not present in the verified facts and must be baselined from the escalation log before savings are quantified.

How we get there: No escalation count, resolution-time, or recurrence figures were provided in the VERIFIED FACTS, so no measured numbers are asserted here. Impact magnitude should be derived once the escalation log is baselined for volume, average and variance of resolution time, and theme frequency.

How it's delivered. Begin by baselining the customer service escalation log to quantify escalation volume, current resolution time (average and spread), and the frequency of each recurring dispute theme drawn from the EDI dispute working notes. Define the theme taxonomy and map each theme to its accountable role using the O2C RACI. Build an AI classification and retrieval capability that tags new escalations, assembles context from the order flow, EDI dispute notes and receivables review, and surfaces prior resolutions for the same theme. Keep a human-in-the-loop checkpoint for low-confidence classifications and novel cross-functional cases. Layer theme analytics on top to feed a root-cause backlog so recurring disputes are eliminated rather than repeatedly re-worked.

Who uses it. Customer Service agent, Credit / Collections analyst, Order Management specialist, O2C process owner

Expected behaviour. Incoming escalations are classified against known dispute themes, enriched with relevant context and prior resolutions, and routed to the correct accountable role per the RACI, with humans handling low-confidence and novel cases and recurring themes feeding a root-cause backlog.

Escalation & human fallback. Low-confidence classifications and novel cross-functional disputes are escalated to a human agent for triage and routing; recurring themes are escalated to the O2C process owner for root-cause action.

Sources. Customer service escalation log, EDI dispute resolution working notes, O2C process RACI, Order flow analysis export, Accounts receivable review notes **Formats.** Escalation log records, Working notes, RACI matrix, Tabular order flow export

Connects: Escalation log / case management system, EDI dispute notes repository, Order flow data export, Accounts receivable review data

Success looks like:

- Reduction in average escalation resolution time versus the baselined escalation log
- Reduction in variability (spread) of resolution time across escalations
- Reduction in recurrence frequency of the top dispute themes over time
- Proportion of escalations auto-classified and correctly routed without manual re-routing
- Share of escalations resolved using surfaced prior-resolution context

Dependencies: Independent — can start immediately.

Risks:

- Escalation log categorisation is currently inconsistent, which may limit initial classification accuracy until the taxonomy is cleaned
- RACI ambiguity for cross-functional disputes could cause mis-routing even with automation
- Without a baselined resolution-time and recurrence dataset, benefits cannot be quantified or tracked
- Over-reliance on prior resolutions could propagate a previously incorrect resolution pattern

Where this comes from: Customer Service Escalation Log 2025, EDI Dispute Resolution CS Working Notes, O2C Process RACI Europe, Order Flow Analysis Export 2025 and Accounts Receivable Review Notes Q4 2025

Address: Orders still arriving via Fax and Email despite EDI dominance

AUTOMATION PIPELINE

Although EDI is the dominant order-entry channel across the organisation Europe's order-to-cash operation, a residual volume of orders continues to arrive via fax and email. These manual channels bypass the structured, validated, system-to-system flow that EDI provides, forcing customer service agents to re-key order data into SAP by hand. Manual re-keying introduces transcription errors, slows order acknowledgement, and consumes agent capacity that could otherwise be directed at exception handling and customer-facing work. This opportunity targets the migration of remaining fax and email order senders onto EDI (or a structured digital capture equivalent), and the automated capture and conversion of any non-EDI orders that cannot be migrated, so that every order entering the operation is validated and posted through a consistent, low-touch path.

TODAY

1. Order received on a manual channel

Customer / Customer Service · Email / Fax

A customer transmits an order by fax or email rather than through EDI. The order lands in a shared mailbox or fax queue and waits for an agent to pick it up, with no automatic acknowledgement back to the customer.

No automatic receipt confirmation

Orders can sit unworked in a queue

Arrival time depends on agent availability

2. Agent reads and interprets the order

Customer Service · Email / Fax

A customer service agent opens the fax image or email, identifies the customer account, and interprets product codes, quantities and delivery requirements from a free-format document.

Free-format documents are ambiguous

Customer or product identification errors

Manual effort scales linearly with volume

3. Manual re-keying into SAP

Customer Service · SAP S/4

The agent keys the order line-by-line into the SAP order-entry transaction, reproducing data the customer already holds in structured form.

Transcription errors at line level

No upstream validation against master data

Time-consuming per order

4. Downstream correction and dispute handling

Customer Service / AR · SAP S/4 / CRM

Errors introduced during re-keying surface later as delivery discrepancies, invoice disputes or customer escalations that must be investigated and corrected.

Rework loops

Customer dissatisfaction

Delayed cash collection from disputed invoices

WITH THE CHANGE

1. Channel migration to EDI

EDI / Onboarding team · EDI

Customers still sending by fax or email are systematically onboarded onto EDI through the established integration and onboarding process, so their orders arrive as structured, system-to-system transactions.

Smaller customers may lack EDI capability

Onboarding requires customer-side effort

2. Automated capture for residual non-EDI orders

Automation / Customer Service · Capture automation

For senders that cannot move to EDI, inbound email and fax orders are captured and parsed automatically into a structured format, removing manual reading from the agent's path.

Document quality affects parsing accuracy

Edge-case formats need agent review

3. Validated automatic order creation

Automation · SAP S/4

Captured order data is validated against customer and product master data and posted into SAP automatically, with confirmation returned to the customer.

Validation failures must route cleanly to a human queue

Master data gaps block straight-through posting

4. Exception-only agent handling

Customer Service · SAP S/4

Agents handle only the orders that fail validation or parsing, focusing their time on genuine exceptions rather than routine re-keying.

Requires clear exception routing rules

Agent skill shift toward exception resolution

Business impact. Fax and email orders carry a disproportionate cost because they are the only channel that requires full manual re-keying, and each re-keyed order is a fresh opportunity for transcription error that later surfaces as a delivery discrepancy or invoice dispute. Migrating these senders to EDI, and automating capture for those who cannot migrate, removes the manual touch from the bulk of order entry while reducing the error-driven rework and escalations that follow. The value is concentrated in two places:

reclaimed agent capacity from eliminating routine re-keying, and fewer downstream disputes caused by manual entry errors.

How we get there: Impact is described qualitatively against the documented order-flow channels because no verified numeric volumes for fax/email orders, agent effort, or dispute counts were supplied for this section. No measured figures are asserted.

How it's delivered. Begin by quantifying the residual fax and email order population from the order-flow analysis and segmenting senders into those that can be migrated to EDI versus those that must remain on a manual channel. For the migratable segment, run a structured EDI onboarding campaign using the existing integration register and onboarding guide. For the non-migratable residual, deploy automated email/fax capture that parses order content, validates it against SAP customer and product master data, and posts straight-through where validation passes, routing only exceptions to agents. Establish a clear exception queue and routing rules so agents transition from re-keying to exception resolution.

Who uses it. Customer Service Agent, EDI / Integration team, Customer Onboarding team

Expected behaviour. Every inbound order is validated and posted through a consistent low-touch path; agents handle only genuine exceptions, and customers receive timely order confirmation.

Escalation & human fallback. Orders that fail automated validation or cannot be parsed route to a customer service exception queue for manual resolution.

Sources. Order management SOP, EDI integration register, Retail customer onboarding guide, Order flow analysis **Formats.** Fax image, Email, EDI message

Connects: SAP S/4 order entry, EDI platform, Inbound email / fax capture

Success looks like:

- Reduction in the share of orders entering via fax and email
- Increase in the share of orders captured straight-through without manual re-keying
- Reduction in order-entry transcription errors and the disputes they generate
- Reduced agent time spent on routine order re-keying

Dependencies: Independent — can start immediately.

Risks:

- Smaller or long-tail customers may be unable or unwilling to adopt EDI, leaving a persistent manual residual
- Automated capture accuracy depends on inbound document quality; poor scans or unstructured emails will still require agent review

- Master data gaps in SAP can block straight-through posting and undermine the automation benefit
- Without disciplined exception routing, automation can shift rather than reduce agent workload

Where this comes from: Order Flow Analysis Export 2025, Order Management SOP Europe, EDI Integration Register Europe, Retail Customer Onboarding Guide Europe, O2C Process RACI Europe, SAP S/4HANA Customer Master Export and Customer Service Escalation Log 2025

REPORT 05 OF 06

Transformation Roadmap

Order-to-Cash · Autonomous Discovery Assessment

REPORT REFERENCE	Report 05 of 06
DOMAIN	Order-to-Cash
PREPARED BY	AuroPro · Autonomous Discovery Platform
CLASSIFICATION	Confidential

Contents

1	Implementation roadmap
2	Horizon detail
3	Planning assumptions

Transformation Roadmap

The recommended opportunities, sequenced across three horizons.

Strategic direction. Stabilise-then-standardise: close the highest-volume operational gaps first (EDI fulfilment and governance), then establish a single authoritative source for customer master data, then build durable controls and monitoring.

1 Implementation roadmap

2 Horizon detail

H1 — Stabilise EDI fulfilment and stop the recurring revenue leakage (0-6 months)

- **Recover the unfulfilled EDI order backlog** — 1,196 EDI orders worth €12.36m sit unfulfilled — far above the unfulfilled Manual (320) and Email (111) order counts — representing immediate at-risk revenue and customer-service exposure that should be triaged and recovered first.
- **Formalise EDI exception handling into the order-management SOP** — The order-management SOP explicitly states 'EDI is not covered by this version of the SOP', leaving the channel that carries 67.3% of orders without documented process; codifying the existing manual re-entry workaround as an interim controlled procedure reduces dependence on undocumented intervention.
- **Reduce the largest escalation root cause: unprocessed EDI orders** — 'EDI order not processed — manual intervention required' accounts for 34 escalations (23.9% of all escalations), the single largest driver; targeting it directly cuts customer-service load and resolution delays.

H2 — Standardise governance and reconcile customer master data (6-18 months)

- **Add EDI dispute resolution to the O2C RACI** — The O2C RACI 'covers Manual (telephone) and Email order channels only' and the CS working notes confirm 'there is no row in the O2C RACI for EDI'; assigning clear accountability for EDI disputes closes the ownership gap that allows the largest escalation category to persist.
- **Establish SAP S/4HANA as the enforced single system of record for credit data** — Policy states 'SAP S/4HANA is the sole authoritative source for all customer credit limits' yet review notes confirm 'our credit policy does not define which system is authoritative' in practice; operationalising the authoritative source resolves the contradiction before reconciliation can hold.
- **Reconcile divergent credit limits and payment terms across systems** — 267 of 318 matched accounts mismatch on credit limit and 228 mismatch on payment terms, with €30.68m of aggregate absolute credit-limit divergence; the Carrefour France case (ERP €1.8m vs CRM €2.4m, a €0.6m delta) illustrates the material per-account exposure to be corrected.

H3 — Embed durable controls and continuous monitoring (18+ months)

- **Implement ongoing EDI fulfilment monitoring** — With EDI representing €59.71m of order value (66.8% of total) and having generated 1,196 unfulfilled orders, sustained monitoring prevents the backlog from re-accumulating after the H1 recovery.
- **Establish continuous master-data integrity controls** — Sustaining the single-system-of-record decision requires preventing drift from recurring across the 318 matched accounts where 267 credit-limit and 228 payment-term mismatches were found, so divergence does not re-emerge after reconciliation.

3 Planning assumptions

The forward-looking elements of this roadmap — dates, owners, service levels, targets, cadence and sequence — are planning assumptions, not measured findings. They are shown here explicitly so they can be confirmed before delivery.

PLANNING ASSUMPTION — CONFIRM BEFORE DELIVERY

These forward-looking items are recommendations, not measured facts.

TYPE	ASSUMPTION	BASIS
OWNERSHIP	Issue and publish an updated Order Management SOP and O2C RACI that explicitly cover the EDI channel and name an accountable owner for EDI dispute resolution.	<i>Order Management SOP states 'EDI is not covered by this version of the SOP' and working notes confirm there is no row in the O2C RACI for EDI.</i>
SEQUENCING	Designate SAP S/4HANA as the enforced single authoritative source for customer credit limits and payment terms, and remediate the divergent accounts in a prioritised sequence (largest-delta accounts first).	<i>Credit policy names SAP S/4HANA as the sole authoritative source, but review notes state the policy does not define which system is authoritative; 267 of 318 accounts mismatch on credit limit.</i>
TARGET	Set a target threshold for EDI order fulfilment and escalation reduction to track progress against the current baseline.	<i>1,196 EDI orders worth EUR 12,362,493.74 unfulfilled and 34 manual-intervention escalations representing 23.9% of all escalations.</i>

TYPE	ASSUMPTION	BASIS
OWNERSHIP	Designate a single accountable owner for reconciling the SAP S/4HANA and SAP CRM customer master records.	<i>The credit-management policy states SAP S/4HANA is the sole authoritative source, while the accounts-receivable review notes state the credit policy does not define which system is authoritative.</i>
SEQUENCING	Establish an EDI exception-handling process and add an EDI row to the O2C RACI.	<i>EDI is not covered by the order-management SOP and there is no row in the O2C RACI for EDI, yet EDI accounts for 67.3% of order rows.</i>
OWNERSHIP	Designate SAP S/4HANA as the enforced single source of record for credit limits and payment terms, with CRM reconciled to it.	<i>Credit policy states S/4HANA is the sole authoritative source, but review notes confirm the policy does not define which system is authoritative in practice.</i>
OWNERSHIP	Establish a documented owner and RACI row for EDI order processing and EDI dispute resolution.	<i>EDI is excluded from the SOP and there is no row in the O2C RACI for EDI dispute resolution.</i>
SERVICE LEVEL	Set a target resolution-time SLA for customer escalations to compress the current spread.	<i>Logged resolution times range from 3 to 67 hours with no stated standard.</i>
SEQUENCING	Prioritise reconciliation of the highest-delta accounts first, starting with Carrefour France.	<i>Carrefour France is the largest single credit-limit delta at EUR 600,000.</i>
SEQUENCING	Sequence the master-data reconciliation and system-of-record decision ahead of the EDI process workstream.	<i>Policy names SAP S/4HANA as sole authoritative source while the credit policy does not define which system is authoritative; 267 of 318 accounts mismatched.</i>
OWNERSHIP	Assign accountability for the EDI workstream to the O2C Process Owner role.	<i>EDI has no row in the O2C RACI and is not covered by the SOP.</i>
TARGET	Set a target threshold to reduce the EDI manual-intervention escalation share below its current level.	<i>34 escalations, 23.9% of all escalations, from EDI orders requiring manual intervention.</i>

TYPE	ASSUMPTION	BASIS
CADENCE	Establish a recurring CRM-to-S/4HANA reconciliation cadence as an ongoing control.	<i>Aggregate absolute credit-limit divergence of EUR 30,675,000 across mismatched accounts.</i>
SERVICE LEVEL	Define response-time SLAs for EDI exception handling.	<i>1,196 unfulfilled EDI orders worth EUR 12,362,493.74 currently handled via manual re-entry.</i>
TIMING	H1 activities are scheduled across the first 0-6 months from programme start.	<i>1,196 unfulfilled EDI orders worth €12.36m requiring immediate recovery</i>
TIMING	H2 governance and reconciliation work runs across months 6-18.	<i>267 of 318 accounts mismatch on credit limit; €30.68m aggregate divergence</i>
TIMING	H3 monitoring and control work begins at 18+ months once recovery and reconciliation are complete.	<i>EDI order value of €59.71m (66.8% of total) requires ongoing monitoring</i>
OWNERSHIP	Accountability for EDI dispute resolution should be assigned to a named O2C process owner when the RACI is updated.	<i>CS working notes: 'there is no row in the O2C RACI for EDI'</i>
TARGET	A target reconciliation threshold (e.g. zero unexplained credit-limit mismatches) should be agreed for the 318 matched accounts.	<i>267 credit-limit and 228 payment-term mismatches across 318 matched accounts</i>
CADENCE	EDI fulfilment and master-data integrity should be reviewed on a recurring cadence (e.g. monthly) once controls are live.	<i>34 escalations (23.9%) from unprocessed EDI orders indicate a recurring failure pattern</i>
SERVICE LEVEL	An SLA for resolving EDI processing escalations should be defined to drive down resolution times.	<i>'EDI order not processed' is the largest escalation root cause at 34 cases (23.9%)</i>
SEQUENCING	Backlog recovery is sequenced ahead of process formalisation and governance changes.	<i>1,196 unfulfilled EDI orders worth €12.36m represent immediate at-risk revenue</i>
OWNERSHIP	Assign a named Customer Service owner and a backup for the EDI exception queue, recorded in the O2C RACI.	<i>Today EDI failures are handled ad hoc by individual agents with no documented owner, per the EDI dispute-resolution working notes and order management SOP.</i>

TYPE	ASSUMPTION	BASIS
SERVICE LEVEL	Define a resolution SLA (e.g. capture-to-order-created within a fixed window) measured from the moment of failure capture.	<i>Failures are currently discovered reactively via customer chases, often after the requested ship date, per the customer service escalation log.</i>
CADENCE	Review recurring failure reasons on a regular cadence to drive EDI mapping fixes.	<i>Recurring failure reasons are evidenced in the EDI integration register but not yet systematically fed back.</i>
TARGET	Set a frequency/risk threshold above which a failure reason is promoted from manual handling to auto-correction.	<i>The triage playbook distinguishes known failure reasons documented in the EDI dispute-resolution working notes.</i>
SEQUENCING	Deliver human-in-the-loop capture and triage first, then automate the highest-frequency low-risk reasons.	<i>Resolution work is already performed manually by Customer Service per the O2C RACI.</i>
SERVICE LEVEL	Define a target detection-to-resolution SLA for EDI exceptions once baseline resolution times are measured from the worklist.	<i>Failed EDI transactions are currently discovered reactively when customers chase missing deliveries (edi-dispute-resolution-cs-working-notes)</i>
OWNERSHIP	Assign accountability for the EDI exception worklist to a named resolver role using the existing O2C RACI.	<i>O2C RACI defines accountability across order management and customer service (o2c-process-raci-the organisation-europe)</i>
TARGET	Set a target threshold for the proportion of failed EDI transactions resolved before customer contact.	<i>Current detection depends on the customer noticing the missing order (customer-service-escalation-log-2025)</i>
CADENCE	Establish a recurring review cadence of EDI failure root-cause categories to prioritise the master-data prevention backlog.	<i>Root causes are not currently captured for prevention (edi-dispute-resolution-cs-working-notes)</i>
OWNERSHIP	Designate the SAP S/4 credit master as the authoritative system of record for credit limits, since it is the value enforced at order entry.	<i>ERP credit master is used for order-entry credit checks per the order management SOP and credit management policy</i>

TYPE	ASSUMPTION	BASIS
SEQUENCING	Run the initial CRM-to-ERP reconciliation as a one-time cleanse before enabling automated synchronisation.	<i>Divergence exists between sap-crm-customer-export and sap-s4-customer-master-export with no authoritative source</i>
CADENCE	Review flagged divergence exceptions on a recurring cadence owned by credit management.	<i>Credit management policy governs credit limit setting and review</i>
TARGET	Set a target of zero diverging accounts maintained after go-live.	<i>Success metric of no divergence between CRM and ERP credit limits</i>
OWNERSHIP	Master data to be designated owner of the authoritative payment-terms source, with customer service handling routed exceptions.	<i>O2C RACI assigns responsibilities across master data, customer service and AR.</i>
SEQUENCING	Run a one-off full-base reconciliation to clear existing mismatches before enabling ongoing order-entry validation.	<i>Divergence exists in the current S/4 and CRM customer records.</i>
CADENCE	Run the cross-system reconciliation on a recurring schedule once the back-catalogue is cleared.	<i>Terms can diverge again whenever records are edited in either system.</i>
TARGET	Define the tolerated divergence between systems as zero against the authoritative source.	<i>Credit management policy defines the agreed term per customer.</i>
SERVICE LEVEL	Establish a resolution-time SLA per escalation theme once the escalation log baseline is available.	<i>Customer service escalation log records escalations but no SLA is defined in the verified facts</i>
OWNERSHIP	Assign an accountable owner for the theme taxonomy and root-cause backlog, aligned to the O2C RACI.	<i>O2C RACI defines accountable roles across the order-to-cash process</i>
TARGET	Set a minimum classification-confidence threshold below which escalations are routed to a human for triage.	<i>AI classification of escalation themes against recurring dispute categories</i>
CADENCE	Review recurring dispute themes on a regular cadence to prioritise root-cause fixes.	<i>Recurring dispute themes recorded in the EDI dispute resolution working notes</i>

TYPE	ASSUMPTION	BASIS
SEQUENCING	Baseline the escalation log before build begins so savings can be measured against a starting point.	<i>No resolution-time or volume figures exist in the verified facts</i>
TARGET	Set a target threshold for the maximum acceptable share of orders arriving via fax and email after migration	<i>Order-flow analysis shows EDI is dominant but fax and email channels persist</i>
SERVICE LEVEL	Define a straight-through processing SLA for automated capture and posting of non-EDI orders	<i>Manual re-keying currently sits in the customer service order-entry path</i>
SEQUENCING	Sequence EDI migration of capable senders before deploying capture automation for the non-migratable residual	<i>Migration to EDI removes orders from the manual channel entirely, shrinking the automation scope</i>
OWNERSHIP	Assign an owner for the EDI onboarding campaign and the exception-handling queue	<i>Existing EDI integration register and retail onboarding guide define the onboarding process</i>

2 Success metrics framework

How the impact of the recommended interventions should be measured once live — the dimension, what it means, and the target to hold delivery to.

METRIC	DEFINITION	TARGET
Credit-limit master-data alignment rate	Share of matched customer accounts where the credit limit in CRM equals the credit limit in SAP S/4HANA, the named authoritative source. Baseline: 267 of 318 matched accounts are mismatched.	Increase toward full alignment
Payment-terms alignment rate	Share of matched accounts where payment terms agree between ERP and CRM. Baseline: 228 accounts mismatched.	Increase toward full alignment
Aggregate absolute credit-limit divergence	Total absolute difference in EUR between ERP and CRM credit limits across accounts. Baseline: EUR 30,675,000.	Decrease toward zero
EDI straight-through processing rate	Share of EDI orders processed without manual intervention, measured against unfulfilled EDI volume. Baseline: 1,196 unfulfilled EDI orders worth EUR 12,362,493.74.	Increase
EDI manual-intervention escalation share	Escalations attributed to 'EDI order not processed — manual intervention required' as a percentage of all escalations. Baseline: 34 escalations, 23.9% of total.	Decrease
EDI governance coverage	Whether the EDI channel is covered by the order-management SOP and represented with named accountability in the O2C RACI. Baseline: EDI is not covered by the SOP and has no RACI row.	Achieve full coverage

3 Where the failures concentrate

SHARE OF UNFULFILLED ORDERS BY CHANNEL

4 System & data-flow map

The systems view of the same domain — which business systems the process touches and how data moves between them.

SYSTEMS THE PROCESS TOUCHES, AND HOW DATA MOVES BETWEEN THEM
