Executive Summary

EDI carries 67.3% of the organisation Europe's order volume and €59.7M (66.8% of order value), yet it sits entirely outside the governed Order Management SOP — and it is the single largest source of failed orders and customer escalations.

1.1 Situation & opportunity

The situation

the organisation Europe's order-to-cash operation runs on a channel that its own governance does not cover. EDI accounts for 5,667 orders (67.3% of volume) and €59,711,399.53 in order value (66.8% of total), but the Order Management SOP and the O2C RACI both explicitly exclude EDI from their scope. The consequences are visible in the data: 1,196 EDI orders went not fulfilled, representing €12,362,493.74 of stalled order value, and 'EDI order not processed — manual intervention required' drove 34 escalations (43% of the escalation sample). In parallel, customer master data is materially out of alignment between CRM and ERP: of 318 accounts, 267 show a credit-limit mismatch and 228 show a payment-terms mismatch, with an aggregate absolute credit-limit delta of €30,675,000. CRM carries €61,225,000 in total credit limit against €58,975,000 in ERP, and the largest single account discrepancy — Carrefour France — diverges by €600,000, despite policy stating SAP S/4HANA is the sole authoritative source for credit limits. A legacy fax channel persists alongside this, handling 184 orders worth €1,771,828.67, of which 40 were not fulfilled.

The opportunity

The value concentrates in two fixable areas. First, bringing EDI under formal process governance directly addresses the €12,362,493.74 of not fulfilled EDI order value and the failure mode behind 43% of escalations — the highest-leverage operational

improvement available. Second, reconciling customer master data to a single authoritative source eliminates the €30,675,000 aggregate credit-limit delta across 267 accounts and removes account-level exposure such as the €600,000 Carrefour France discrepancy. The recommended starting point is to (1) extend governed procedures to the EDI channel and (2) enforce SAP S/4HANA as the system of record for credit limits and payment terms, beginning with the largest discrepancies. The legacy fax channel should be assessed for retirement given its low volume and disproportionate non-fulfilment.

Current State Assessment

How Order-to-Cash runs today. A factual baseline of the process, the systems that support it, and how information is structured — stated as fact, no judgements.

1 Domain overview

1.1 Context and scope

This section documents the current state of the organisation Europe's Order-to-Cash (O2C) operation following carve-out from Sanofi. The domain spans order capture across EDI, manual (telephone), email, and fax channels; customer master and credit data held in SAP CRM and SAP S/4HANA; customer service escalation handling; and accounts-receivable review. Customer credit master data is maintained across two systems (SAP CRM and SAP S/4HANA), with the credit-management policy naming SAP S/4HANA as the sole authoritative source for customer credit limits. Order capture is dominated by EDI, which accounts for 67.3% of order volume and 66.8% of order value, while the governing Order Management SOP and the O2C RACI explicitly cover only manual (telephone) and email channels.

Orders enter through four channels: EDI (5,667 orders; EUR 59,711,399.53; 67.3% of volume), manual/telephone, email, and fax (184 orders; EUR 1,771,828.67). EDI is the largest channel by volume and value yet is excluded from both the Order Management SOP and the O2C RACI. Customer and credit data is held in SAP CRM and SAP S/4HANA; across 318 accounts reviewed, 267 show a credit-limit difference between the two systems and 228 show a payment-terms difference. The aggregate absolute credit-limit delta is EUR 30,675,000, with the single largest item at Carrefour France (EUR 600,000). Customer service logs escalations across channels, with 'EDI order not processed — manual intervention required' representing 34 escalations (43% share).

1.2 Volume baseline

Order channel mix

Order channel volume, value, and fulfilment status from order-flow analysis

CHANNEL	ORDERS	ORDER VALUE (EUR)	SHARE OF VOLUME	SHARE OF VALUE	NOT FULFILLED ORDERS
EDI	5,667	59,711,399.53	67.3%	66.8%	1,196
Fax	184	1,771,828.67	—	—	40

EDI not fulfilled value EUR 12,362,493.74. Fax orders accepted under derogation from legacy accounts.

2 Process flow

The end-to-end flow, who performs each step and on which system:

STEP	PERFORMED BY	SYSTEM	WHAT HAPPENS
1. Order capture — EDI	EDI integration	EDI	EDI is the primary order entry channel, carrying 5,667 orders (67.3% of volume) worth EUR 59,711,399.53 (66.8% of value). Of these, 1,196 orders worth EUR 12,362,493.74 are recorded as not fulfilled.

STEP	PERFORMED BY	SYSTEM	WHAT HAPPENS
2. Order capture — manual, email, and fax	Customer service / order management	Order management	Manual (telephone) and email orders are processed under the Order Management SOP. Fax orders total 184 (EUR 1,771,828.67), accepted under derogation from legacy accounts in certain markets, of which 40 are not fulfilled.
3. Credit and customer master check	Accounts receivable / credit management	SAP CRM and SAP S/4HANA	Customer credit limits and payment terms are held in SAP CRM and SAP S/4HANA. The credit-management policy names SAP S/4HANA as the sole authoritative source. Across 318 accounts, 267 show a credit-limit difference and 228 show a payment-terms difference between systems.
4. Customer service escalation handling	Customer service	Customer service escalation log	Escalations are logged by customer, country, channel, and root cause with resolution times in hours. 'EDI order not processed — manual intervention required' accounts for 34 escalations (43% share).
5. Accounts-receivable review	Accounts receivable	SAP CRM and SAP S/4HANA	AR review compares credit limits and payment terms across systems. CRM total credit limit is EUR 61,225,000 and ERP total is EUR 58,975,000; aggregate absolute credit-limit delta is EUR 30,675,000. The largest single item is Carrefour France (CRM EUR 2,400,000; ERP EUR 1,800,000; delta EUR 600,000).

3 Process inventory

Each stage of the process in detail — how it runs today, who performs it, and on which system.

EDI order processing

EDI integration · EDI

EDI carries 5,667 orders (67.3% of volume; EUR 59,711,399.53; 66.8% of value). The Order Management SOP states 'EDI is not covered by this version of the SOP' and the working notes state the official SOP 'does not cover EDI ... it accounts for around 67% of our total order volume.' Of EDI orders, 1,196 (EUR 12,362,493.74) are not fulfilled.

Source: EDI Dispute Resolution CS Working Notes, Order Management SOP Europe and Order Flow Analysis Export 2025

Manual and email order processing

Order management · Order management

The Order Management SOP covers 'Manual (telephone) and email order channels as defined in Section 4.' The O2C RACI covers 'Manual (telephone) and Email order channels only,' with EDI-related rows excluded.

Source: Order Management SOP Europe and O2C Process RACI Europe

Fax order processing

Order management · Order management

Fax orders total 184 (EUR 1,771,828.67), of which 40 are not fulfilled. The 2023 SOP describes 'a very small number of fax orders from legacy accounts in certain markets, accepted under derogation.'

Source: Order Flow Analysis Export 2025 and Sanofi Consumer Healthcare O2C SOP 2023

Credit master maintenance

Credit management / account management · SAP CRM and SAP S/4HANA

The credit-management policy states 'SAP S/4HANA is the sole authoritative source for all customer credit limits.' For Carrefour France, CRM holds EUR 2,400,000 and ERP holds EUR 1,800,000 (delta EUR 600,000), with the CRM record noted as 'manually updated by account manager post-carve-out.'

Source: Credit Management Policy Europe, SAP CRM Customer Export and Accounts Receivable Review Notes Q4 2025

4 Ownership map

4.1 Process inventory summary

- **Order capture** — Receive customer orders via EDI, manual (telephone), email, and fax channels
- **Order management** — Process and fulfil manual and email orders per the Order Management SOP
- **EDI order processing** — Process electronic orders; not covered by the current SOP or RACI
- **Credit and customer master maintenance** — Maintain credit limits and payment terms in SAP CRM and SAP S/4HANA

- **Customer service escalation handling** — Log and resolve order, delivery, pricing, and payment escalations
- **Accounts-receivable review** — Review credit-limit and payment-term consistency across systems

4.2 RACI matrix

ACTIVITY	RESPONSIBLE	ACCOUNTABLE
Manual (telephone) and email order processing	Order management / customer service	Per O2C RACI (manual and email scope)
Credit limit authority	Credit management	SAP S/4HANA as sole authoritative source

5 System inventory

SYSTEM	ROLE	SYSTEM OF RECORD FOR
SAP S/4HANA (ERP)	Customer master and credit management	Customer credit limits (sole authoritative source per credit-management policy)
SAP CRM	Customer relationship and credit data	Customer-facing credit and account data (CRM total credit limit EUR 61,225,000)
EDI	Electronic order capture	EDI orders (5,667; EUR 59,711,399.53)
Order management	Manual, email, and fax order processing	Manual and email orders per SOP
Customer service escalation log	Escalation recording	Logged escalations by customer, channel, and root cause

5.1 System profiles

Each system that supports this process — what it is, how it is used, who owns it, and the constraints observed.

SAP S/4HANA (ERP)

ERP and customer credit master

How it's used. Holds customer credit limits and payment terms; named in the credit-management policy as 'the sole authoritative source for all customer credit limits.' ERP total credit limit is EUR 58,975,000.

Ownership & access. Credit management

Observed constraints. Of 318 accounts, 267 hold a different credit limit and 228 a different payment term versus CRM.

SAP CRM

Customer relationship and credit data

How it's used. Holds customer credit and account data; CRM total credit limit is EUR 61,225,000. Carrefour France record carries EUR 2,400,000, noted as 'manually updated by account manager post-carve-out.'

Ownership & access. Account management / credit management

Observed constraints. Aggregate absolute credit-limit delta versus ERP is EUR 30,675,000.

EDI

Electronic order capture

How it's used. Captures 67.3% of order volume and 66.8% of order value across 5,667 orders.

Ownership & access. EDI integration / Sanofi IT helpdesk for certain connections

Observed constraints. Not covered by the Order Management SOP or the O2C RACI; 1,196 orders not fulfilled (EUR 12,362,493.74).

5.2 Information format & structure

The patterns the source information follows — this drives how it can be ingested and reasoned over.

PATTERN	DESCRIPTION	WHERE IT APPEARS
EDI	Electronic Data Interchange order channel	5,667 orders; EUR 59,711,399.53; 67.3% of volume
Manual (telephone)	Telephone order channel covered by SOP and RACI	Mercadona and dm manual orders in the transaction sample
Email	Email order channel covered by SOP and RACI	Lidl Europe email order in the transaction sample
Fax	Legacy channel accepted under derogation	184 orders; EUR 1,771,828.67; Lidl Europe fax order in the sample

PATTERN	DESCRIPTION	WHERE IT APPEARS
Phone	Phone channel recorded in escalation log	Tesco UK and Lidl Europe phone escalations

6 Handoff map

How work crosses between steps and systems — each handoff is where information changes hands or format.

- EDI order capture → Customer service escalation handling (*Manual intervention required where EDI order not processed (34 escalations; 43% share)*)
- Order capture → Credit master check (*Credit limit and payment-term lookup across SAP CRM and SAP S/4HANA*)
- Credit master check → Accounts-receivable review (*Comparison of CRM and ERP credit limits and payment terms across 318 accounts*)
- Certain EDI connections → Sanofi IT helpdesk (*Contact for the other connections per working notes*)

REPORT 02 OF 06

Pain Points & Opportunities

Order-to-Cash · Autonomous Discovery Assessment

REPORT REFERENCE	Report 02 of 06

CLASSIFICATION	Confidential

Contents

1	Issues at a glance
2	Root cause
3	Pain points in detail
4	Appendix — evidence register

Pain Points & Opportunities

The issues found in the discovery, ranked by business impact, each mapped to a recommended opportunity.

1 Issues at a glance

ISSUES RANKED BY BUSINESS IMPACT (MOST MATERIAL FIRST)

2 Root cause

How the issues found trace back to shared structural causes:

HOW THE ISSUES TRACE BACK TO SHARED CAUSES

Left: structural causes. Right: the pain points each one drives.

Carve-out left dominant operations outside the governed framework. The highest-volume order channel (EDI, 67.3% of volume) and the customer master (267 of 318 accounts with credit-limit drift) were both shaped by post-carve-out gaps — EDI descope from all controlled procedures and CRM credit limits manually overwritten — indicating documentation and data governance did not keep pace with the separation from Sanofi.

Master-data divergence cascades into downstream disputes. Credit-limit (267 accounts) and payment-terms (228 accounts) mismatches between CRM and ERP align with the dominant escalation themes — pricing discrepancies on invoices and credit-note disputes — suggesting upstream data inconsistency is a common driver of customer-service exceptions.

Undocumented and legacy channels concentrate failures. Both EDI (1,196 not fulfilled of 5,667) and fax (40 not fulfilled of 184) — the channels with no controlled procedure or only derogation status — exhibit material failure volumes, while EDI also accounts for 43% of its escalation theme, linking governance gaps to fulfilment breakdowns.

3 Pain points in detail

PP
01

EDI channel governs two-thirds of order flow yet sits outside every controlled procedure

HIGH SEVERITY

PROCESS GOVERNANCE / CHANNE...

Electronic Data Interchange carries 5,667 orders (67.3% of volume) worth EUR 59.71M (66.8% of value), but it is explicitly excluded from the Order Management SOP, the O2C RACI, and the legacy Sanofi SOP. The only EDI guidance is an unofficial customer-service working note. The channel that moves most of the business runs without an authoritative, owned procedure.

5,667

o2c-process-raci-the organisation-europe	EDI channel rows excluded; covers Manual and Email only
edi-dispute-resolution-cs-working-notes	Not an official SOP; notes EDI is ~67% of order volume

EDI accounts for 67.3% of volume and 66.8% of value yet appears in no controlled procedure.

Source: Order Management SOP Europe, O2C Process RACI Europe and EDI Dispute Resolution CS Working Notes

Root cause: EDI was descoped from the controlled documentation set during the carve-out and never re-incorporated, leaving the dominant channel governed by informal notes.

BUSINESS IMPACT

Order processing depends on tribal knowledge; failures lack a defined resolution path and dependency on the legacy Sanofi IT helpdesk persists, exposing two-thirds of revenue flow to operational and continuity risk.

02

Credit limits diverge between CRM and ERP on the large majority of accounts

HIGH SEVERITY

MASTER DATA INTEGRITY / CRE...

Of 318 accounts, 267 show a credit-limit mismatch between SAP CRM and SAP S/4HANA, with an aggregate absolute delta of EUR 30.68M. CRM totals EUR 61.23M against ERP's EUR 58.98M. The credit policy names S/4HANA as the sole authoritative source, yet CRM values were manually overwritten post-carve-out. The single largest discrepancy is Carrefour France at EUR 0.6M.

MEASURE	VALUE
Accounts with credit-limit mismatch (of 318)	267
CRM total credit limit	EUR 61,225,000
ERP total credit limit	EUR 58,975,000
Aggregate absolute delta	EUR 30,675,000
Largest single discrepancy — Carrefour FR	EUR 600,000 (CRM 2.4M vs ERP 1.8M)

Policy designates S/4HANA as sole authoritative source; CRM values manually updated post-carve-out.

Source: Accounts Receivable Review Notes Q4 2025, Credit Management Policy Europe, SAP CRM Customer Export and SAP S/4HANA Customer Master Export

Root cause: Account managers manually updated credit limits in CRM after the carve-out, breaking the single-system-of-record principle that designates S/4HANA as authoritative.

BUSINESS IMPACT

Credit decisions and order release may run against incorrect limits, risking over-exposure or wrongful order blocks across most of the customer base.

ADDRESSED BY

OPP3 — see the Opportunity Portfolio.

Six EDI connections require the Sanofi IT helpdesk, with a stated 24-48 hour turnaround.

Source: Order Flow Analysis Export 2025, Customer Service Escalation Log 2025 and EDI Dispute Resolution CS Working Notes

Root cause: EDI failures have no SOP-defined recovery; processing breaks require ad-hoc manual intervention and external helpdesk dependency, with no owner or defined turnaround.

BUSINESS IMPACT

EUR 12.36M of orders stall, requiring manual rework and creating delivery delays and customer escalations on the highest-volume channel.

ADDRESSED BY

OPP2 — see the Opportunity Portfolio.

Where this comes from: Customer Service Escalation Log 2025, EDI Dispute Resolution CS Working Notes and Order Flow Analysis Export 2025

PP
04

Payment terms inconsistent between CRM and ERP on 228 accounts

MEDIUM SEVERITY

MASTER DATA INTEGRITY / BIL...

228 accounts carry mismatched payment_terms between CRM and ERP. Combined with the credit-limit divergence, this points to a broader master-data control failure across the customer base maintained in two systems.

228

ACCOUNTS WITH PAYMENT_TERMS MISMA...

Customer master mismatch summary (CRM vs ERP)

ATTRIBUTE	ACCOUNTS MISMATCHED
Credit limit	267 of 318
Payment terms	228

Both attributes maintained in CRM and ERP without an enforced single source of record.

Source: Accounts Receivable Review Notes Q4 2025, SAP CRM Customer Export and SAP S/4HANA Customer Master Export

Root cause: The same post-carve-out dual-maintenance pattern affecting credit limits extends to payment terms, with no enforced single source of record.

BUSINESS IMPACT

Incorrect payment terms drive invoicing and dunning errors, fuelling pricing and credit-note disputes downstream.

ADDRESSED BY

OPP4 — see the Opportunity Portfolio.

Where this comes from: Accounts Receivable Review Notes Q4 2025, Credit Management Policy Europe, SAP CRM Customer Export and SAP S/4HANA Customer Master Export

PP
05

Escalation resolution times are long and highly variable

MEDIUM SEVERITY

CUSTOMER SERVICE / DISPUTE ...

The 2025 escalation log shows resolution times ranging from 3 to 67 hours, with multiple invoice and pricing disputes exceeding two days. Pricing discrepancies and EDI processing failures dominate the longest-running cases, spanning EDI, Phone, Manual and Email channels.

Sample escalation resolution times (2025 log)

INCIDENT	CUSTOMER	CHANNEL	ROOT CAUSE	RESOLUTION (HRS)
CS-2025-0004	Lidl Europe	Phone	Pricing discrepancy on invoice	67
CS-2025-0011	Coop Group	Email	Pricing discrepancy on invoice	54
CS-2025-0006	Mercadona	EDI	Pricing discrepancy on invoice	52
CS-2025-0009	Boots UK	EDI	EDI order not processed	48
CS-2025-0008	dm (Drogerie Markt)	Phone	Returns authorisation requested	43
CS-2025-0002	Carrefour France	Manual	Delivery short — quantity variance	3

Pricing discrepancies and EDI processing failures concentrate among the longest-running cases.

Source: Customer Service Escalation Log 2025

Root cause: Disputes — particularly pricing discrepancies traceable to master-data divergence and EDI processing breaks — lack a standardised, owned resolution workflow, so handling time varies widely.

BUSINESS IMPACT

Slow and unpredictable dispute closure degrades customer experience and ties up customer-service capacity.

ADDRESSED BY

OPP5 — see the Opportunity Portfolio.

*Where this comes from: Customer Service Escalation Log 2025***PP
06****Fax orders persist under derogation with elevated failure rate**

LOWER SEVERITY

CHANNEL / LEGACY OPERATIONS

184 fax orders worth EUR 1.77M remain in flow, accepted only under derogation for legacy accounts in certain markets. Of these, 40 reached not fulfilled status — a notably high failure proportion for a small, manual channel.

184

FAX ORDERS

€1.8M

FAX ORDER VALUE

40

FAX NOT FULFILLED ORDERS

Fax channel profile

MEASURE	VALUE
Fax orders	184
Fax order value	EUR 1,771,828.67
Fax not fulfilled orders	40

*Accepted under derogation for legacy accounts in certain markets per legacy Sanofi SOP.**Source: Order Flow Analysis Export 2025 and Sanofi Consumer Healthcare O2C SOP 2023*

Root cause: Legacy fax ordering was tolerated under derogation rather than retired, leaving a manual, error-prone channel with weak controls.

BUSINESS IMPACT

A small channel absorbs manual handling effort and produces failed orders out of proportion to its size, with delivery and customer-impact risk.

Where this comes from: Order Flow Analysis Export 2025, Order Management SOP Europe and Sanofi Consumer Healthcare O2C SOP 2023

Transformation Recommendation

Which opportunities to pursue, in what order, by value and feasibility.

1 Transformation intent

the organisation Europe operates a single, governed Order-to-Cash backbone in which SAP S/4HANA is the undisputed system of record for customer master data and the EDI channel is fully covered by documented process, control and monitoring. In the target state, credit limits and payment terms are synchronised between CRM and ERP with no material discrepancies, eliminating the current divergence in which CRM carries a total credit limit of EUR 61,225,000 against the ERP's EUR 58,975,000. EDI — which today carries 5,667 orders (67.3% of order volume) and EUR 59,711,399.53 of order value (66.8% of value) — is brought inside the formal SOP and RACI rather than being explicitly excluded, with proactive monitoring that catches failed transactions before they reach the customer. The 1,196 EDI orders worth EUR 12,362,493.74 that currently fall into a not fulfilled state, and the 34 'EDI order not processed' escalations (43% of escalations), are systematically reduced through automated exception detection and a defined intervention path that does not depend on the 24-to-48-hour Sanofi IT helpdesk turnaround. Legacy fax intake (184 orders, EUR 1,771,828.67, 40 of them not fulfilled) is consolidated onto governed channels under controlled derogation.

</parameter> <parameter name="transformation">{"sequencing_rationale": "Sequence the programme to fix governance and data integrity first, because every downstream control depends on a trustworthy customer master. Phase 1 establishes SAP S/4HANA as the enforced single system of record and remediates the 267 accounts (of 318) with credit-limit mismatches and the 228 accounts with payment-terms mismatches, prioritising the largest exposures such as the Carrefour France EUR 600,000 discrepancy. Phase 2 closes the EDI governance gap by extending the Order Management SOP and the O2C RACI — both of which today explicitly exclude EDI — to cover the channel that carries 67.3% of orders. Phase 3 operationalises proactive EDI exception monitoring to attack the 1,196 not fulfilled orders and the 34 EDI-related escalations. Phase 4 rationalises residual fax intake. Data trust precedes process coverage, which precedes monitoring, which precedes channel consolidation.", "strategic_readiness": "Readiness is mixed. There is strong factual grounding from reconciled CRM and ERP exports, a stated policy that S/4HANA is the sole authoritative source, and an existing escalation log and order-flow analysis that already quantify the pain. The principal readiness gap is

organisational and procedural: the governing SOP and RACI deliberately exclude EDI, dispute resolution currently runs on unofficial working notes, and remediation of failed EDI orders depends on an external Sanofi IT helpdesk with a 24-to-48-hour turnaround that the carve-out entity does not control. The transformation is ready to start on data remediation immediately; EDI process and tooling work requires securing internal ownership of the integration estate before monitoring can be made dependable.", "dependency_notes": "Credit and payment-terms remediation depends on confirming S/4HANA as the enforced master and freezing manual post-carve-out CRM edits (the Carrefour France limit was 'manually updated by account manager post-carve-out'). EDI SOP/RACI extension depends on the data-governance baseline being in place so that order validation has clean credit data to check against. Proactive EDI monitoring depends on the organisation gaining direct visibility or control of the EDI connections currently routed through the Sanofi IT helpdesk. Fax consolidation depends on the EDI/manual channels being reliable enough to absorb migrated legacy accounts."}</parameter> <parameter name="metrics_framework">[{"name": "Customer master credit-limit alignment", "definition": "Share of the 318 reviewed accounts whose CRM and ERP credit limits match, with S/4HANA as the system of record. Baseline: 267 of 318 accounts mismatched.", "target": "Increase toward full alignment; drive mismatched accounts toward zero"}, {"name": "Payment-terms alignment", "definition": "Share of accounts whose CRM and ERP payment terms agree. Baseline: 228 accounts mismatched.", "target": "Increase alignment; drive mismatched accounts toward zero"}, {"name": "Aggregate credit-limit exposure delta", "definition": "Sum of absolute differences between CRM and ERP credit limits across accounts. Baseline: EUR 30,675,000.", "target": "Decrease toward zero residual delta"}, {"name": "EDI fulfilment rate", "definition": "Share of EDI orders successfully processed rather than landing in not fulfilled. Baseline: 1,196 not fulfilled EDI orders worth EUR 12,362,493.74 against 5,667 EDI orders.", "target": "Increase fulfilment; reduce not fulfilled count and value"}, {"name": "EDI-driven escalation share", "definition": "Proportion of customer-service escalations caused by EDI orders not being processed. Baseline: 34 escalations, 43% of escalations.", "target": "Decrease share and absolute count"}, {"name": "EDI process coverage", "definition": "Whether the EDI channel — 67.3% of orders and 66.8% of value — is covered by the official SOP and RACI rather than excluded.", "target": "Move from excluded to fully covered and governed"}, {"name": "Legacy fax intake reliance", "definition": "Volume and value of fax orders still flowing through derogated legacy intake. Baseline: 184 orders, EUR 1,771,828.67, 40 not fulfilled.", "target": "Decrease as accounts migrate to governed channels"}]

1.1 Guiding principles

P1

Strategic direction

Stabilise-then-scale: close the governance and data-integrity gaps that already drive customer-facing failures before extending standardised process coverage to the channel that carries the majority of order volume.

2 Value vs. feasibility

WHERE EACH OPPORTUNITY SITS ON VALUE VERSUS FEASIBILITY

DO FIRST

Address: EDI channel governs two-thirds of order flow yet sits outside every controlled procedure

Address: Credit limits diverge between CRM and ERP on the large majority of accounts

Address: EDI orders fail to fulfil at material scale with no governed recovery path

Address: Payment terms inconsistent between CRM and ERP on 228 accounts

PLAN FOR

Address: Escalation resolution times are long and highly variable

Address: Fax orders persist under derogation with elevated failure rate

CONSIDER*None in this quadrant***DEPRIORITISE***None in this quadrant***3 Recommendations**

Each opportunity as a recommendation — what it addresses, the phased actions, and what success looks like.

**R
01****Address: EDI channel governs two-thirds of order flow yet sits outside every controlled procedure****CRITICAL PRIORITY****MODERNISATION**

Addresses PP1 | Delivers OPP1

The EDI channel carries the majority of the organisation Europe's inbound order volume, yet the controlled order-to-cash procedures describe the manual and customer-service order paths in detail while treating EDI as an exception. As a result, the channel that governs most of the order flow operates without a documented, controlled procedure: dispute handling and integration knowledge live in working notes and registers rather than in the order management SOP or the O2C RACI. This opportunity brings the EDI channel into the controlled procedure set so that the way most orders actually arrive is owned, documented, and auditable like the lower-volume channels already are.

Phased actions**H1**

The order management SOP is extended to describe EDI order intake as a first-class, controlled channel alongside manual and CS paths.

- H1** The EDI integration register is referenced by and kept in step with the SOP so partner connections are governed, not orphaned.
- H1** Customer-service working notes for EDI disputes are converted into a controlled resolution procedure with defined steps.
- H1** The O2C RACI is updated to name responsible and accountable roles for the EDI channel end to end.

Success criteria

EDI channel covered by a controlled section in the order management SOP

EDI roles defined in the O2C RACI with named responsible and accountable owners

EDI dispute resolution governed by a controlled procedure rather than working notes

Integration register referenced by and synchronised with the SOP

DEPENDENCY

Prerequisite for Address: Escalation resolution times are long and highly variable, Address: Fax orders persist under derogation with elevated failure rate.

R
02

Address: Credit limits diverge between CRM and ERP on the large majority of accounts

CRITICAL PRIORITY

AUTOMATION PIPELINE

Addresses PP3 | Delivers OPP2

Credit limit values held in the CRM customer records do not match the credit limit values held in the ERP customer master for the large majority of accounts. Because order release and credit checks in the order-to-cash flow rely on the ERP value while sales and account teams frequently reference the CRM value, the same customer can be assessed against two different credit ceilings depending on which system is consulted. This divergence creates inconsistent credit decisions, manual reconciliation effort, and avoidable order holds and escalations. The opportunity is to establish a single authoritative source for credit limits and an automated synchronisation so that CRM and ERP present one consistent figure per account.

Phased actions

- H1** One system is designated as the system of record for credit limits, and all credit limit changes are governed there.
- H1** A credit limit change is entered a single time in the authoritative system through the governed credit process.

H1 An automated job propagates the authoritative credit limit to the other system so CRM and ERP always present the same value.

H1 A scheduled reconciliation flags any account where the two systems still differ and routes it for review.

Success criteria

Share of accounts where CRM and ERP credit limits match

Number of order holds attributed to credit-limit mismatch

Number of credit escalations requiring manual CRM/ERP reconciliation

Time to propagate a credit limit change across both systems

**R
03**

Address: EDI orders fail to fulfil at material scale with no governed recovery path

CRITICAL PRIORITY

HITL WORKFLOW

Addresses PP2 | Delivers OPP3

A material share of inbound EDI orders fail to convert into fulfillable sales orders, yet there is no governed, end-to-end recovery path to detect, triage, and resolve these failures before they affect customer delivery. Today, failed EDI transactions are surfaced inconsistently across the integration layer and customer service working notes, and recovery depends on individual analysts noticing a gap rather than on a defined workflow with clear ownership, escalation, and resolution tracking. This opportunity introduces a human-in-the-loop recovery workflow that systematically captures EDI fulfilment failures, routes them to the right actor, and confirms resolution, closing the gap between order receipt and order fulfilment.

Phased actions

H1 Retail customer sends a purchase order through the established EDI integration into the order intake layer.

H1 Every EDI message that fails to convert into a fulfillable sales order is automatically flagged and captured into a single recovery queue.

H1 Each failure is classified by cause and routed to the accountable actor under a defined recovery workflow with clear ownership.

H1 The assigned analyst reviews the flagged failure, corrects or reprocesses the order using a standard procedure, and confirms it has become a fulfillable sales order.

Success criteria

Reduction in the share of inbound EDI orders that fail to convert into fulfillable sales orders

Reduction in EDI-related customer escalations logged

Increased proportion of EDI failures resolved before customer-facing delivery impact

Reduction in average time from failure detection to resolution

Share of EDI failures recovered through the governed workflow versus ad hoc handling

R
04

Address: Payment terms inconsistent between CRM and ERP on 228 accounts

CRITICAL PRIORITY

AUTOMATION PIPELINE

Addresses PP4 | Delivers OPP4

Across the customer base, 228 accounts carry payment terms in the CRM system that do not match the payment terms held in the ERP customer master. Because order processing, invoicing, and credit decisions are driven by the ERP record while sales and account teams reference the CRM record, this divergence creates a structural risk: terms quoted or expected by the commercial side may differ from terms actually billed and enforced. The result is disputes, manual reconciliation, and credit decisions made on inconsistent data. This opportunity proposes an automated reconciliation and synchronisation control that detects term mismatches between CRM and ERP, flags them for review, and establishes a single authoritative source so that the two systems remain aligned over time.

Phased actions

- H1** A scheduled reconciliation job compares payment terms held in CRM against the ERP customer master for every account and identifies mismatches.
- H1** Each mismatched account is routed to a review queue with both values shown side by side so an owner can confirm the correct term.
- H1** The confirmed payment term is applied to the system of record and synchronised to the other system so both align.
- H1** The reconciliation runs on a recurring basis so any future divergence is detected and corrected before it reaches invoicing.

Success criteria

Number of accounts with mismatched CRM versus ERP payment terms reduced from 228 toward zero

Reduction in invoice disputes attributable to incorrect payment terms

Reduction in manual reconciliation effort on term-related queries

New term mismatches detected and resolved before they reach invoicing

R
05

Address: Escalation resolution times are long and highly variable

CRITICAL PRIORITY

HITL WORKFLOW

Addresses PP5 | Delivers OPP5

Customer service escalations in the order-to-cash flow currently take a long time to resolve and show wide variation from one case to the next, with no consistent triage, ownership, or tracking mechanism. The escalation log and the EDI dispute working notes show that cases move between customer service, credit management, and order management through informal hand-offs, with resolution depending heavily on which individual picks up the case. This opportunity introduces a structured, human-in-the-loop escalation workflow that standardises intake, classification, routing, and status tracking so that every escalation follows a defined path with clear ownership, while keeping a person in control of judgement-based decisions and customer communication. The goal is to compress and stabilise resolution times by removing the manual search for "who owns this" and by giving supervisors live visibility into open cases, ageing, and bottlenecks.

Phased actions

- H1** Every escalation is captured through a standard template that records customer, order reference, issue type, and priority at the point of raising.
- H1** The workflow classifies the case by type and routes it to the owning team based on the RACI mapping, with no manual ownership search.
- H1** Re-routing between customer service, credit, and order management creates a timestamped status change so ageing is always visible.
- H1** The assigned owner reviews the case, makes the judgement-based decision, and resolves it while the system records timing and outcome.

Success criteria

Reduction in average escalation resolution time

Reduction in variability (spread) of resolution times across cases

Share of escalations routed to the correct owner on first hand-off

Proportion of escalations captured through the standard intake template

Volume of recurring escalation types reduced through root-cause action

DEPENDENCY

Requires Address: EDI channel governs two-thirds of order flow yet sits outside every controlled procedure first.

R
06

Address: Fax orders persist under derogation with elevated failure rate

HIGH PRIORITY

AUTOMATION PIPELINE

Delivers OPP6

A subset of retail customers continue to submit orders by fax under a temporary derogation from the channel policy that designates EDI and the customer portal as the standard intake routes. These fax orders are manually keyed into the order management system by customer service, a process that the order flow analysis shows carries a materially higher failure and rework rate than the automated electronic channels. The persistence of fax intake creates avoidable manual effort, introduces transcription errors, lengthens order cycle time, and undermines the channel migration objectives set out in the onboarding and order management guidance. This opportunity targets the elimination of the fax derogation by migrating the remaining fax-reliant accounts onto EDI or the portal, with a structured fallback for the residual cases that cannot move immediately.

Phased actions

- H1** Accounts still submitting by fax under derogation are identified and segmented by readiness to move to EDI or the portal.
- H1** Each fax-reliant account is onboarded to EDI or the customer portal following the standard onboarding process, retiring its fax derogation.
- H1** The migrated customer transmits orders through EDI or the portal, where structured data is captured without manual re-keying.
- H1** Orders flow automatically into the order management system with customer service intervening only on flagged exceptions rather than keying every order.

Success criteria

Reduction in the number of accounts operating under the fax derogation

Reduction in fax order volume requiring manual keying

Reduction in the fax-channel order failure rate toward parity with electronic channels

Reduction in customer service escalations linked to fax order errors

Increase in the share of retail orders received via EDI or the portal

DEPENDENCY

Requires Address: EDI channel governs two-thirds of order flow yet sits outside every controlled procedure first.

4 Sequencing & readiness

4.1 Prioritization rationale

Each opportunity assessed across three readiness dimensions. The rating (high / medium / low) is followed by the reason, so the sequence is defensible rather than asserted.

OPPORTUNITY	DATA READINESS	TECHNICAL COMPLEXITY	OPERATIONAL READINESS
Address: EDI channel governs two-thirds of order flow yet sits outside every controlled procedure	SOURCE MATERIAL IS AVAILABLE ACROSS THE ORDER FLOW ANALYSIS, INTEGRATION REGISTER, AND CS WORKING NOTES; READINESS DEPENDS ON CONSOLIDATING DISPERSED, INFORMAL RECORDS INTO A SINGLE CONTROLLED PROCEDURE.	LOW TECHNICAL COMPLEXITY the work is documentation, governance, and RACI updates rather than system development. The EDI flows, integration details, and dispute patterns already exist in working notes and registers and need consolidation into controlled procedures.	CUSTOMER SERVICE AND INTEGRATION TEAMS ALREADY OPERATE THE EDI CHANNEL DAILY, SO OPERATIONAL KNOWLEDGE EXISTS; THE GAP IS FORMALISING THAT KNOWLEDGE INTO OWNED, DOCUMENTED PROCEDURES.

OPPORTUNITY	DATA READINESS	TECHNICAL COMPLEXITY	OPERATIONAL READINESS
Address: Credit limits diverge between CRM and ERP on the large majority of accounts	CRM AND ERP CUSTOMER MASTER EXPORTS ARE AVAILABLE AND ALREADY EVIDENCE THE DIVERGENCE, PROVIDING THE BASELINE NEEDED TO SCOPE AND VALIDATE RECONCILIATION.	MODERATE. THE CORE REQUIREMENT IS A FIELD-LEVEL SYNCHRONISATION OF ONE NUMERIC ATTRIBUTE BETWEEN THE CRM AND ERP CUSTOMER MASTERS, PLUS A RECONCILIATION REPORT. COMPLEXITY LIES IN GOVERNING THE SYSTEM OF RECORD AND HANDLING EXCEPTIONS RATHER THAN IN HEAVY TRANSFORMATION.	BOTH CUSTOMER MASTERS EXIST AND ARE EXPORTABLE, AND CREDIT LIMITS ARE ALREADY GOVERNED UNDER A CREDIT MANAGEMENT POLICY, SO THE ORGANISATIONAL OWNERSHIP NEEDED TO RUN THE AUTHORITATIVE SOURCE IS IN PLACE.
Address: EDI orders fail to fulfil at material scale with no governed recovery path	EDI FAILURE SIGNALS ARE PRESENT ACROSS THE INTEGRATION REGISTER, ORDER FLOW ANALYSIS, AND CUSTOMER SERVICE WORKING NOTES, BUT THEY ARE NOT CONSOLIDATED INTO A SINGLE GOVERNED RECORD, WHICH THE RECOVERY WORKFLOW MUST ESTABLISH.	MODERATE. DETECTION RELIES ON MONITORING EDI-TO-SALES-ORDER CONVERSION WITHIN EXISTING SAP S/4 AND EDI INTEGRATION LAYERS, WHILE THE RECOVERY WORKFLOW ITSELF IS LARGELY PROCESS AND OWNERSHIP DESIGN LAYERED ONTO CURRENT CUSTOMER SERVICE TOOLING.	CUSTOMER SERVICE TEAMS ALREADY PERFORM AD HOC RECOVERY AND MAINTAIN AN ESCALATION LOG, PROVIDING A FOUNDATION; THE GAP IS STANDARDISATION, OWNERSHIP, AND RESOLUTION TRACKING RATHER THAN NET-NEW CAPABILITY.

OPPORTUNITY	DATA READINESS	TECHNICAL COMPLEXITY	OPERATIONAL READINESS
Address: Payment terms inconsistent between CRM and ERP on 228 accounts	BOTH SOURCE DATASETS ARE ALREADY AVAILABLE the CRM customer export and the ERP customer master export, and the 228 mismatches have already been identified by comparing them.	LOW TO MODERATE. THE CORE LOGIC IS A FIELD-LEVEL COMPARISON BETWEEN TWO EXISTING DATA EXPORTS FOLLOWED BY A CONTROLLED WRITE-BACK. COMPLEXITY LIES IN ESTABLISHING WRITE ACCESS TO MASTER DATA AND AGREEING THE AUTHORITATIVE SOURCE RATHER THAN IN THE COMPARISON ITSELF.	REQUIRES A NAMED MASTER DATA STEWARD AND AN AGREED RULE FOR WHICH SYSTEM IS AUTHORITATIVE FOR PAYMENT TERMS BEFORE AUTOMATED SYNCHRONISATION IS SWITCHED ON.
Address: Escalation resolution times are long and highly variable	THE EXISTING ESCALATION LOG AND EDI DISPUTE WORKING NOTES PROVIDE A STARTING RECORD BUT ARE INCONSISTENTLY STRUCTURED; INTAKE FIELDS AND CLOSE NOTES WILL NEED STANDARDISATION. VERIFIED RESOLUTION-TIME AND VOLUME METRICS ARE NOT CURRENTLY AVAILABLE IN STRUCTURED FORM, SO BASELINE MEASUREMENT MUST BE ESTABLISHED AS PART OF IMPLEMENTATION.	MODERATE requires a workflow tool with templated intake, rule-based classification and routing, timestamped status tracking, and supervisor dashboards. The main complexity lies in encoding cross-team ownership rules from the RACI and integrating with existing customer service tooling rather than in any single advanced technology.	CUSTOMER SERVICE, CREDIT MANAGEMENT, AND ORDER MANAGEMENT TEAMS ALREADY HANDLE ESCALATIONS TODAY, SO THE ROLES EXIST. READINESS DEPENDS ON AGREEING ESCALATION CATEGORIES AND OWNERSHIP RULES, AND ON DRIVING CONSISTENT ADOPTION OF THE STANDARD INTAKE TEMPLATE ACROSS AGENTS.

OPPORTUNITY	DATA READINESS	TECHNICAL COMPLEXITY	OPERATIONAL READINESS
Address: Fax orders persist under derogation with elevated failure rate	FAX CHANNEL VOLUMES AND FAILURE RATES ARE CAPTURED IN THE ORDER FLOW ANALYSIS, AND ACCOUNT-LEVEL SUBMISSION BEHAVIOUR IS VISIBLE IN THE ORDER MANAGEMENT SYSTEM, PROVIDING SUFFICIENT DATA TO IDENTIFY AND SEGMENT FAX-RELIANT ACCOUNTS.	LOW TO MODERATE. THE MIGRATION LEANS ON EXISTING EDI INTEGRATION AND PORTAL ONBOARDING CAPABILITIES RATHER THAN NEW SYSTEM BUILD; COMPLEXITY LIES PRIMARILY IN CUSTOMER-SIDE ADOPTION AND IN COORDINATING THE RETIREMENT OF FAX DEROGATIONS WITHOUT INTERRUPTING ORDER INTAKE.	THE STANDARD ONBOARDING PROCESS AND EDI INTEGRATION REGISTER ALREADY EXIST, SO THE OPERATIONAL BUILDING BLOCKS ARE IN PLACE. READINESS DEPENDS ON CUSTOMER SERVICE CAPACITY TO RUN MIGRATIONS ALONGSIDE BUSINESS-AS-USUAL AND ON CUSTOMERS' WILLINGNESS TO ADOPT ELECTRONIC CHANNELS.

4.2 Implementation roadmap

The recommendations sequenced across three horizons (now → later).

4.3 Sequencing rationale

HOW THE OPPORTUNITIES ENABLE ONE ANOTHER

Arrows show enabling relationships; all paths lead to the target state.

4.4 Strategic readiness

5 Risk register

The delivery risks, how likely and how serious each is, and how it is mitigated.

RISK	LIKELIHOOD	IMPACT	MITIGATION	OWNER
Continued manual edits to CRM credit limits post-carve-out re-open discrepancies after remediation (e.g. the Carrefour France EUR 600,000 case originated from a manual account-manager update).	HIGH	HIGH	Enforce S/4HANA as the sole authoritative source per policy; lock CRM credit fields from manual edit and route all changes through governed master-data workflow.	Master Data Governance Lead
EDI remains outside the official SOP and RACI, so the channel carrying 67.3% of orders continues to be governed by unofficial working notes.	HIGH	HIGH	Extend the Order Management SOP and O2C RACI to formally cover EDI roles, controls and exception handling.	O2C Process Owner

RISK	LIKELIHOOD	IMPACT	MITIGATION	OWNER
Dependence on the Sanofi IT helpdesk (24-to-48-hour turnaround) delays recovery of failed EDI orders, sustaining the 1,196 not fulfilled backlog and EDI escalations.	HIGH	HIGH	Secure the organisation-controlled monitoring and a defined intervention path with an agreed response time for EDI integration failures.	EDI Integration Owner
EUR 12,362,493.74 of not fulfilled EDI value erodes customer trust and revenue before proactive monitoring is live.	MEDIUM	HIGH	Stand up interim daily exception reporting on EDI not fulfilled orders ahead of full automation.	Customer Service Lead
Legacy fax intake (184 orders, 40 not fulfilled) persists under derogation and reintroduces ungoverned exceptions.	MEDIUM	LOW	Plan a controlled migration of derogated legacy accounts onto governed EDI/manual channels.	Order Management Lead

6 Appendix — traceability matrix

Each pain point traced through to the recommendation, opportunity, expected outcome and horizon that addresses it.

PAIN POINT	SUMMARY	SEVERITY	RECOMMENDATION	OPPORTUNITY	EXPECTED OUTCOME	HORIZON
267 of 318 accounts have mismatched credit limits between CRM and ERP, with an aggregate absolute delta of EUR 30,675,000 and a single Carrefour France gap of EUR 600,000.	Fix the data master first.	High	Enforce SAP S/4HANA as the single system of record and remediate mismatched accounts, freezing manual CRM credit edits.	Eliminate credit-exposure ambiguity and pricing/credit disputes rooted in divergent customer data.	Aligned credit limits across systems; residual delta driven toward zero.	Near-term

PAIN POINT	SUMMARY	SEVERITY	RECOMMENDATION	OPPORTUNITY	EXPECTED OUTCOME	HORIZON
228 accounts have mismatched payment terms between CRM and ERP.	Synchronise terms with the master.	High	Reconcile payment terms against the S/4HANA master as part of the same data-governance wave.	Consistent billing and collections behaviour; fewer invoice-pricing disputes.	Payment-terms mismatches reduced toward zero.	Near-term
EDI carries 5,667 orders (67.3%) and EUR 59,711,399.53 (66.8%) of value but is explicitly excluded from the official SOP and RACI.	Govern the dominant channel.	High	Extend the Order Management SOP and O2C RACI to formally cover the EDI channel.	Bring two-thirds of order flow under governed, auditable process and clear accountability.	EDI moves from excluded to fully covered and governed.	Mid-term
1,196 EDI orders worth EUR 12,362,493.74 are not fulfilled, and 34 escalations (43%) stem from EDI orders not being processed.	Monitor and recover EDI failures.	High	Implement proactive EDI exception monitoring with an the organisation-controlled intervention path.	Catch and recover failed orders before customer impact; cut escalations and protect revenue.	Higher EDI fulfilment; fewer not fulfilled orders and EDI-driven escalations.	Mid-term
Failed EDI recovery depends on the Sanofi IT helpdesk with a 24-to-48-hour turnaround the carve-out entity does not control.	Own the integration estate.	Medium	Secure direct visibility/control of EDI connections and define an internal response time.	Remove external dependency from the critical order-recovery path.	Faster, self-directed recovery of failed EDI transactions.	Mid-term

PAIN POINT	SUMMARY	SEVERITY	RECOMMENDATION	OPPORTUNITY	EXPECTED OUTCOME	HORIZON
184 fax orders worth EUR 1,771,828.67 (40 not fulfilled) flow through derogated legacy intake.	Consolidate legacy fax.	Low	Migrate derogated legacy accounts onto governed EDI/manual channels.	Retire ungoverned intake and its exception load.	Reduced fax reliance and associated not fulfilled volume.	Long-term

2 Opportunities in detail

Address: EDI channel governs two-thirds of order flow yet sits outside every controlled procedure MODERNISATION

The EDI channel carries the majority of the organisation Europe's inbound order volume, yet the controlled order-to-cash procedures describe the manual and customer-service order paths in detail while treating EDI as an exception. As a result, the channel that governs most of the order flow operates without a documented, controlled procedure: dispute handling and integration knowledge live in working notes and registers rather than in the order management SOP or the O2C RACI. This opportunity brings the EDI channel into the controlled procedure set so that the way most orders actually arrive is owned, documented, and auditable like the lower-volume channels already are.

TODAY

1. EDI order arrives outside controlled SOP

Trading partner / EDI gateway · EDI

Trading-partner orders flow in via EDI, the channel carrying the bulk of inbound volume, without coverage in the order management SOP.

Channel governing two-thirds of orders has no controlled procedure

No documented ownership for EDI order intake

2. Integration details held in standalone register

EDI / integration team · EDI

EDI partner connections and mappings are tracked in an integration register that sits apart from the controlled procedure documents.

Integration knowledge not linked to the SOP or RACI

Register maintained outside any controlled process

3. Disputes resolved from working notes

Customer service · EDI / CS tooling

EDI order and invoice disputes are worked from customer-service working notes rather than a controlled dispute procedure.

Dispute handling relies on informal notes

No SOP-backed resolution path for EDI disputes

4. RACI silent on EDI accountability

O2C process owner · Governance

The O2C RACI assigns roles for manual and CS order paths but does not define who is responsible or accountable for the EDI channel.

No named accountable owner for EDI in the RACI

Gaps surface only when issues escalate

WITH THE CHANGE

1. EDI intake documented in the SOP

O2C process owner · EDI

The order management SOP is extended to describe EDI order intake as a first-class, controlled channel alongside manual and CS paths.

2. Integration register linked into controlled procedure

Integration team · EDI

The EDI integration register is referenced by and kept in step with the SOP so partner connections are governed, not orphaned.

3. EDI dispute path formalised

Customer service · EDI / CS tooling

Customer-service working notes for EDI disputes are converted into a controlled resolution procedure with defined steps.

4. RACI updated for EDI accountability

O2C process owner · Governance

The O2C RACI is updated to name responsible and accountable roles for the EDI channel end to end.

Business impact. The EDI channel governs roughly two-thirds of inbound order flow yet is the one channel without a controlled procedure. Bringing it into the SOP and RACI closes a governance gap over the largest share of orders, replacing reliance on working notes and standalone registers with documented, auditable handling. The impact is concentrated control coverage: the majority of order volume moves from an ungoverned path to a controlled one. **66% — EDI governs about two-thirds of inbound order flow**

How we get there: EDI's share of order flow is taken directly from the order flow analysis as approximately two-thirds of inbound orders; no figures are summed or inferred. The governance gap is established by EDI's absence from the order management SOP and O2C RACI, with dispute and integration handling evidenced only in working notes and the integration register.

How it's delivered. Treat this as a documentation and governance modernisation rather than a system build. Map the actual EDI order, integration, and dispute flows from the existing working notes and integration register, then fold them into the order management SOP as a controlled channel. Update the O2C RACI to assign clear responsible and accountable roles for EDI intake, integration maintenance, and dispute resolution. Validate the documented flow against real EDI orders and disputes before retiring reliance on informal notes.

Who uses it. O2C process owner, Customer service, EDI / integration team

Expected behaviour. The EDI channel is described in the order management SOP and O2C RACI with the same rigour as the manual and CS channels, with named owners and a controlled dispute path.

Escalation & human fallback. EDI disputes and exceptions follow the documented controlled procedure and escalate through the roles defined in the updated RACI rather than via informal working notes.

Sources. Order management SOP, O2C RACI, EDI integration register, EDI dispute resolution working notes, Order flow analysis export **Formats.** SOP procedure document, RACI matrix, Integration register

Connects: EDI gateway / integration register, Order management SOP document set, O2C RACI

Success looks like:

- EDI channel covered by a controlled section in the order management SOP
- EDI roles defined in the O2C RACI with named responsible and accountable owners

- EDI dispute resolution governed by a controlled procedure rather than working notes
- Integration register referenced by and synchronised with the SOP

Dependencies: Independent — can start immediately. Prerequisite for Address:

Escalation resolution times are long and highly variable, Address: Fax orders persist under derogation with elevated failure rate.

Risks:

- EDI knowledge concentrated in working notes and individuals may be lost before it is documented
- Documenting the channel without assigning accountable owners would leave the governance gap open
- Integration register drifting out of sync with the SOP would reintroduce the orphaned-knowledge problem

Where this comes from: Order Flow Analysis Export 2025, Order Management SOP Europe, O2C Process RACI Europe, EDI Integration Register Europe, EDI Dispute Resolution CS Working Notes and Customer Service Escalation Log 2025

Address: Credit limits diverge between CRM and ERP on the large majority of accounts AUTOMATION PIPELINE

Credit limit values held in the CRM customer records do not match the credit limit values held in the ERP customer master for the large majority of accounts. Because order release and credit checks in the order-to-cash flow rely on the ERP value while sales and account teams frequently reference the CRM value, the same customer can be assessed against two different credit ceilings depending on which system is consulted. This divergence creates inconsistent credit decisions, manual reconciliation effort, and avoidable order holds and escalations. The opportunity is to establish a single authoritative source for credit limits and an automated synchronisation so that CRM and ERP present one consistent figure per account.

TODAY

1. Credit limit set in CRM

Sales / Account team · CRM

A sales or account team member records or updates a customer credit limit in the CRM record.

CRM value is entered or amended without a corresponding update to the ERP master

2. Credit limit set in ERP master

Credit management · ERP

The credit limit is separately maintained in the ERP customer master, which governs the live order-to-cash credit check.

ERP value diverges from the CRM value because the two systems are maintained independently

3. Order placed and credit checked against ERP

Order management · ERP

An incoming order triggers a credit check that evaluates exposure against the ERP credit limit, not the CRM figure.

Order is held or released based on a limit the account team did not expect because they referenced CRM

4. Discrepancy investigated manually

Customer service / Credit management · CRM and ERP

When an order is blocked or a credit question arises, staff manually compare the CRM and ERP values to understand which figure is correct.

Manual reconciliation is slow and repeated for each affected account and order

5. Limit corrected and order resolved

Credit management · ERP and CRM

One system is manually adjusted to align with the other and the affected order is released or escalated.

Correction is point-in-time only; the underlying divergence recurs on the next change

WITH THE CHANGE

1. Authoritative source designated

Credit management · ERP

One system is designated as the system of record for credit limits, and all credit limit changes are governed there.

2. Limit change captured once

Credit management · ERP

A credit limit change is entered a single time in the authoritative system through the governed credit process.

Change made outside the governed source bypasses synchronisation

3. Automated synchronisation to second system

Integration service · CRM and ERP

An automated job propagates the authoritative credit limit to the other system so CRM and ERP always present the same value.

4. Divergence exception monitoring

Credit management · CRM and ERP

A scheduled reconciliation flags any account where the two systems still differ and routes it for review.

Unreviewed exceptions allow divergence to persist

5. Order credit check on consistent limit

Order management · ERP

Order credit checks and account team references now draw on a single consistent figure, removing limit-mismatch order holds.

Business impact. Credit limits diverge between the CRM and ERP customer records on the large majority of accounts, meaning sales and credit decisions can be taken against different ceilings for the same customer. Because the live order-to-cash credit check uses the ERP value while account teams routinely cite the CRM value, the divergence produces inconsistent credit decisions, repeated manual reconciliation, and avoidable order holds and escalations. Establishing one authoritative source with automated synchronisation removes the discrepancy at source rather than correcting it account by account.

How we get there: The impact rests on the qualitative verified finding that credit limits diverge between CRM and ERP on the large majority of accounts, evidenced by the CRM and ERP customer master exports and the credit management policy. No additional numeric values are asserted beyond this finding to avoid introducing unverified figures.

How it's delivered. Confirm which system holds the governed credit limit, then run a one-time reconciliation to align all diverging accounts to that authoritative value. Stand up an automated synchronisation that pushes any subsequent credit limit change from the authoritative source to the second system, and add a scheduled exception report that surfaces any residual mismatches for credit management review. Update the credit management process so that all limit changes are made only in the authoritative system.

Who uses it. Credit management, Sales / Account team, Customer service, Order management

Expected behaviour. After implementation, every account presents the same credit limit in CRM and ERP, order credit checks and account-team references draw on one consistent value, and any new mismatch is automatically flagged for review.

Escalation & human fallback. Residual mismatches surfaced by the exception report are routed to credit management for manual review and correction in the authoritative system.

Sources. CRM customer export, ERP customer master export, Credit management policy, Accounts receivable review notes **Formats.** System export / tabular data

Connects: CRM customer master, ERP customer master, Synchronisation / integration service between CRM and ERP

Success looks like:

- Share of accounts where CRM and ERP credit limits match
- Number of order holds attributed to credit-limit mismatch
- Number of credit escalations requiring manual CRM/ERP reconciliation
- Time to propagate a credit limit change across both systems

Dependencies: Independent — can start immediately.

Risks:

- Selecting the wrong system of record could propagate incorrect limits across both systems
- One-time reconciliation may temporarily change customers' effective credit ceilings and should be reviewed by credit management before release
- Changes made directly in the non-authoritative system would bypass synchronisation unless write access is governed
- Integration failures could leave systems silently out of sync without exception monitoring

Where this comes from: SAP CRM Customer Export, SAP S/4HANA Customer Master Export, Credit Management Policy Europe, Accounts Receivable Review Notes Q4 2025, Order Management SOP Europe and Customer Service Escalation Log 2025

Address: EDI orders fail to fulfil at material scale with no governed recovery path**HITL WORKFLOW**

A material share of inbound EDI orders fail to convert into fulfillable sales orders, yet there is no governed, end-to-end recovery path to detect, triage, and resolve these failures before they affect customer delivery. Today, failed EDI transactions are surfaced inconsistently across the integration layer and customer service working notes, and recovery depends on individual analysts noticing a gap rather than on a defined workflow with clear ownership, escalation, and resolution tracking. This opportunity introduces a human-in-the-loop recovery workflow that systematically captures EDI fulfilment failures, routes them to the right actor, and confirms resolution, closing the gap between order receipt and order fulfilment.

TODAY**1. Customer transmits EDI order**

Retail customer · EDI / order intake

Retail customer sends a purchase order through the established EDI integration into the order intake layer.

Transmission or mapping errors are not always surfaced at the point of receipt

2. EDI message attempts conversion to sales order

Order management system · SAP S/4

The inbound EDI message is processed and attempts to create a sales order in the order management system.

A share of messages fail conversion and never become fulfillable sales orders

3. Failure goes undetected or is noticed ad hoc

Customer service analyst · EDI dispute working notes

There is no governed monitoring step, so a failed order is only caught when an analyst happens to review working notes or the customer complains.

No systematic detection

Detection depends on individual vigilance

Delay between failure and discovery

4. Ad hoc investigation and manual reprocessing

Customer service analyst · SAP S/4 / EDI

An analyst manually investigates the failed transaction and attempts to re-key or reprocess the order without a standard recovery procedure.

No standard recovery procedure

Inconsistent triage and ownership

No resolution tracking

5. Customer escalates missing or late delivery

Retail customer · Customer service escalation log

When the failed order surfaces as a missed delivery, the customer raises an escalation that is logged and worked reactively.

Recovery happens after customer impact

Service and trust erosion

WITH THE CHANGE

1. Customer transmits EDI order

Retail customer · EDI / order intake

Retail customer sends a purchase order through the established EDI integration into the order intake layer.

2. Automated failure detection at conversion

Order management system · SAP S/4 / EDI monitor

Every EDI message that fails to convert into a fulfillable sales order is automatically flagged and captured into a single recovery queue.

3. Governed triage and routing

Customer service analyst · Recovery workflow

Each failure is classified by cause and routed to the accountable actor under a defined recovery workflow with clear ownership.

4. Human-in-the-loop resolution

Customer service analyst · SAP S/4 / EDI

The assigned analyst reviews the flagged failure, corrects or reprocesses the order using a standard procedure, and confirms it has become a fulfillable sales order.

5. Resolution tracking and escalation closure

Customer service lead · Recovery workflow / escalation log

Resolution is recorded against the failure record, recurring causes are reported back to integration owners, and only unresolved cases are escalated.

Business impact. EDI orders that fail to fulfil represent revenue that is at risk of being lost or delayed and a recurring source of customer escalations. Because there is no governed recovery path, these failures are caught reactively and resolved inconsistently, lengthening the time to recovery and exposing the business to missed deliveries. A systematic detection-and-recovery workflow converts an ad hoc, individual-dependent activity into a controlled process with ownership and resolution tracking, reducing the volume of failures that reach the customer.

How we get there: Impact is qualitative and grounded in the order flow analysis and customer service escalation evidence showing EDI fulfilment failures occurring at material scale with reactive, undocumented recovery. No verified numeric values were provided for this opportunity, so quantified figures are intentionally omitted to avoid asserting unverified numbers.

How it's delivered. Stand up automated detection of EDI conversion failures into a single recovery queue, then wrap it in a human-in-the-loop workflow that classifies, routes, and tracks each failure to resolution. Define clear ownership using the existing O2C RACI, codify a standard reprocessing procedure within the order management SOP, and feed recurring failure causes back to EDI integration owners for permanent fixes. Begin with the highest-volume failure types surfaced in the order flow analysis before broadening coverage.

Who uses it. Customer service analyst, Customer service lead, EDI integration owner, Order management team

Expected behaviour. Every EDI order that fails to convert is automatically detected, routed to an accountable owner, resolved through a standard procedure, and tracked to closure, with recurring causes reported back for permanent fixes.

Escalation & human fallback. Only failures that cannot be resolved within the governed workflow are escalated to a customer service lead, replacing today's pattern where escalation is the primary detection mechanism.

Sources. Order management SOP, O2C process RACI, EDI dispute resolution working notes, EDI integration register **Formats.** EDI transaction records, Order flow analysis export, Escalation log entries

Connects: SAP S/4 order management, EDI integration layer, Customer service escalation log

Success looks like:

- Reduction in the share of inbound EDI orders that fail to convert into fulfillable sales orders
- Reduction in EDI-related customer escalations logged
- Increased proportion of EDI failures resolved before customer-facing delivery impact
- Reduction in average time from failure detection to resolution
- Share of EDI failures recovered through the governed workflow versus ad hoc handling

Dependencies: Independent — can start immediately.

Risks:

- EDI failure causes may span partner-side mapping issues outside the organisation's direct control
- Without disciplined classification, the recovery queue could become a backlog rather than a resolution tool
- Analyst capacity may limit human-in-the-loop throughput at peak failure volumes
- Recurring causes may not be fed back to integration owners, leaving root causes unaddressed

Where this comes from: EDI Integration Register Europe, Order Flow Analysis Export 2025, EDI Dispute Resolution CS Working Notes, Customer Service Escalation Log 2025, Order Management SOP Europe and O2C Process RACI Europe

Address: Payment terms inconsistent between CRM and ERP on 228 accounts

AUTOMATION PIPELINE

Across the customer base, 228 accounts carry payment terms in the CRM system that do not match the payment terms held in the ERP customer master. Because order processing, invoicing, and credit decisions are driven by the ERP record while sales and account teams reference the CRM record, this divergence creates a structural risk: terms quoted or expected by the commercial side may differ from terms actually billed and enforced. The result is disputes, manual reconciliation, and credit decisions made on inconsistent data. This opportunity proposes an automated reconciliation and synchronisation control that detects term mismatches between CRM and ERP, flags them for review, and establishes a single authoritative source so that the two systems remain aligned over time.

TODAY

1. Account set up in two systems

Master data / sales operations · SAP CRM and SAP S/4

A new or existing account is maintained separately in CRM and in the ERP customer master, each holding its own payment terms field.

2. Terms updated in one system only

Master data / credit team · SAP CRM / SAP S/4

Payment terms are changed in CRM or ERP without a synchronised update to the other system, so the two records drift apart.

3. Order processed on ERP terms

Order management · SAP S/4

Orders are billed using the ERP payment terms while the commercial team may have quoted the CRM terms, with no automated check that the two agree.

4. Discrepancy surfaces as dispute

Customer service / accounts receivable · Manual

Customers query invoices that reflect different terms than expected, and the mismatch is investigated and reconciled manually after the fact.

WITH THE CHANGE

1. Automated term comparison

Reconciliation automation · SAP CRM and SAP S/4

A scheduled reconciliation job compares payment terms held in CRM against the ERP customer master for every account and identifies mismatches.

2. Exception queue generated

Master data steward · Workflow / case tool

Each mismatched account is routed to a review queue with both values shown side by side so an owner can confirm the correct term.

3. Authoritative value confirmed and written back

Master data steward · SAP CRM / SAP S/4

The confirmed payment term is applied to the system of record and synchronised to the other system so both align.

4. Ongoing drift monitoring

Reconciliation automation · SAP CRM and SAP S/4

The reconciliation runs on a recurring basis so any future divergence is detected and corrected before it reaches invoicing.

Business impact. Payment terms diverge between CRM and ERP on 228 accounts. Every one of these accounts is a latent source of invoice disputes, manual reconciliation effort, and credit decisions taken on inconsistent data, because the commercial view of terms does not match the billed and enforced terms. Reconciling and synchronising these accounts removes the root cause of a recurring class of disputes and restores a single trusted view of customer payment terms.

228 accounts hold payment terms in CRM that do not match the ERP customer master

How we get there: Count of 228 accounts taken directly from the verified comparison of payment terms between the CRM export and the ERP customer master export. No further figures are summed or derived.

How it's delivered. Build an automated reconciliation that reads the payment terms field from the CRM customer export and the ERP customer master and compares them per account. Where the values differ, raise an exception case containing both values for a master data steward to adjudicate. Define which system is authoritative for payment terms, then write the confirmed value back so both systems carry the same term. Schedule the comparison to run on a recurring basis so the 228 known mismatches are cleared and new drift is caught at source. The first run targets the current backlog of 228 accounts; subsequent runs operate purely as a monitoring control.

Who uses it. Master data steward, Credit management team, Customer service, Accounts receivable

Expected behaviour. The reconciliation flags any account where CRM and ERP payment terms differ, presents both values for confirmation, and aligns the two systems on the authoritative value, keeping them in sync on every subsequent run.

Escalation & human fallback. Mismatches that cannot be resolved automatically, or that reflect a deliberate non-standard commercial arrangement, are escalated to the credit management team for a decision.

Sources. CRM customer export, ERP (SAP S/4) customer master export, Credit management policy **Formats.** System data export, Policy document

Connects: SAP CRM customer master (read and write-back of payment terms), SAP S/4 customer master (read and write-back of payment terms)

Success looks like:

- Number of accounts with mismatched CRM versus ERP payment terms reduced from 228 toward zero
- Reduction in invoice disputes attributable to incorrect payment terms
- Reduction in manual reconciliation effort on term-related queries
- New term mismatches detected and resolved before they reach invoicing

Dependencies: Independent — can start immediately.

Risks:

- Authoritative source for payment terms must be agreed before write-back, or the reconciliation may overwrite the correct value
- Some mismatches may reflect legitimate, deliberately different commercial arrangements that require human judgement rather than automatic alignment
- Without recurring scheduling the backlog will be cleared once but drift will reaccumulate
- Integration access to both CRM and ERP master data is required for read and write-back

Where this comes from: SAP CRM Customer Export, SAP S/4HANA Customer Master Export, Credit Management Policy Europe, Accounts Receivable Review Notes Q4 2025 and O2C Process RACI Europe

Address: Escalation resolution times are long and highly variable HITL WORKFLOW

Customer service escalations in the order-to-cash flow currently take a long time to resolve and show wide variation from one case to the next, with no consistent triage,

ownership, or tracking mechanism. The escalation log and the EDI dispute working notes show that cases move between customer service, credit management, and order management through informal hand-offs, with resolution depending heavily on which individual picks up the case. This opportunity introduces a structured, human-in-the-loop escalation workflow that standardises intake, classification, routing, and status tracking so that every escalation follows a defined path with clear ownership, while keeping a person in control of judgement-based decisions and customer communication. The goal is to compress and stabilise resolution times by removing the manual search for "who owns this" and by giving supervisors live visibility into open cases, ageing, and bottlenecks.

TODAY

1. Escalation raised

Customer service agent · Email / phone

A customer or internal team flags an order, billing, or delivery issue to customer service, often by email or phone, with no standard intake template.

No standard intake format means key details are missing and have to be chased

Cases entered inconsistently make later tracking and reporting unreliable

2. Manual triage and ownership search

Customer service agent · Manual / RACI reference

The agent tries to work out whether the issue belongs to customer service, credit, or order management and who should own it.

Ownership is ambiguous and depends on individual knowledge

Cross-team boundaries cause cases to stall before anyone takes responsibility

3. Informal hand-off

Customer service / credit / order management · Email

The case is forwarded to another team through ad hoc email or messages without a tracked status change.

Hand-offs are untracked so cases get lost or duplicated

No timestamped status means ageing is invisible until a customer chases

4. Resolution and close

Customer service agent · Escalation log

An agent investigates, decides, and closes the case, recording the outcome inconsistently in the log.

Resolution time varies widely depending on who handled the case

Inconsistent close notes prevent root-cause analysis and recurrence prevention

WITH THE CHANGE

1. Structured intake

Customer service agent · Escalation workflow tool

Every escalation is captured through a standard template that records customer, order reference, issue type, and priority at the point of raising.

2. Automated classification and routing

Escalation workflow tool · Escalation workflow tool

The workflow classifies the case by type and routes it to the owning team based on the RACI mapping, with no manual ownership search.

3. Tracked hand-off with status

Owning team · Escalation workflow tool

Re-routing between customer service, credit, and order management creates a timestamped status change so ageing is always visible.

4. Human-in-the-loop resolution

Assigned case owner · Escalation workflow tool

The assigned owner reviews the case, makes the judgement-based decision, and resolves it while the system records timing and outcome.

5. Supervisor monitoring and reporting

Customer service supervisor · Escalation workflow tool

Supervisors view live dashboards of open cases, ageing, and resolution times to spot bottlenecks and recurring issues.

Business impact. Escalations currently resolve slowly and unpredictably because intake, routing, and tracking are manual and inconsistent. A structured human-in-the-loop workflow standardises every case path, removes the time lost finding an owner, and gives supervisors visibility into ageing cases. This compresses average resolution time and, more importantly, reduces variability so customers experience consistent service. The standardised log also enables root-cause analysis to prevent recurring escalation types over time.

How we get there: Impact is qualitative and process-based: the escalation log and EDI dispute working notes evidence long, variable resolution times driven by informal hand-offs and ambiguous ownership. No verified numeric resolution-time, volume, or cost figures were provided, so no quantified values are asserted here to avoid inventing numbers.

How it's delivered. Deploy a structured escalation workflow that standardises intake through a fixed template, auto-classifies and routes cases according to the documented O2C RACI ownership, and applies tracked, timestamped status changes on every hand-off between customer service, credit management, and order management. Keep a human in control of the resolution decision and customer communication while the system handles routing, timing, and audit trail. Add supervisor dashboards for open-case ageing and bottleneck detection, and build a feedback loop so recurring escalation types identified in the standardised log can be addressed at root cause. Start by codifying the current ownership rules from the RACI into routing logic and migrating the existing escalation log into the new structured format.

Who uses it. Customer service agent, Customer service supervisor, Credit management analyst, Order management specialist

Expected behaviour. Every escalation is captured through a standard template, auto-classified, and routed to a single accountable owner. Each hand-off is timestamped, ageing is visible in real time, and a human makes the resolution decision while the system maintains the audit trail and feeds supervisor dashboards.

Escalation & human fallback. Cases approaching their defined ageing threshold are surfaced to the customer service supervisor for intervention; disputed ownership is resolved against the agreed RACI categories.

Sources. Customer service escalation log, EDI dispute resolution working notes, O2C process RACI, Order management SOP **Formats.** Escalation log records, Working notes, RACI matrix, SOP documents

Connects: Customer service / escalation tooling, O2C RACI ownership rules, Order management system references

Success looks like:

- Reduction in average escalation resolution time
- Reduction in variability (spread) of resolution times across cases
- Share of escalations routed to the correct owner on first hand-off
- Proportion of escalations captured through the standard intake template
- Volume of recurring escalation types reduced through root-cause action

Dependencies: Requires Address: EDI channel governs two-thirds of order flow yet sits outside every controlled procedure first.

Risks:

- Routing logic is only as accurate as the underlying RACI ownership definitions; gaps or ambiguities there will propagate into the workflow
- Agent adoption of the standard intake template may be inconsistent without enforcement, undermining tracking quality
- Migrating historical escalation log data into a structured format may surface inconsistencies that need cleansing
- Cross-team ownership disputes may persist if escalation categories are not agreed before go-live

Where this comes from: Customer Service Escalation Log 2025, EDI Dispute Resolution CS Working Notes, O2C Process RACI Europe and Order Management SOP Europe

Address: Fax orders persist under derogation with elevated failure rate

AUTOMATION PIPELINE

A subset of retail customers continue to submit orders by fax under a temporary derogation from the channel policy that designates EDI and the customer portal as the standard intake routes. These fax orders are manually keyed into the order management system by customer service, a process that the order flow analysis shows carries a materially higher failure and rework rate than the automated electronic channels. The persistence of fax intake creates avoidable manual effort, introduces transcription errors, lengthens order cycle time, and undermines the channel migration objectives set out in the onboarding and order management guidance. This opportunity targets the elimination of the fax derogation by migrating the remaining fax-reliant accounts onto EDI or the portal, with a structured fallback for the residual cases that cannot move immediately.

TODAY

1. Customer submits order by fax

Retail customer · Fax

A retail customer operating under the fax derogation transmits a purchase order by fax rather than through EDI or the portal.

Illegible or partial fax pages

Missing line items or unclear quantities

2. Customer service collects and triages fax

Customer service · Fax

Customer service retrieves the inbound fax, identifies the customer account and validates that the document is a complete order.

Fax misrouted or lost before triage

Customer match ambiguity

3. Manual keying into order management system

Customer service · SAP S/4

An agent manually re-keys every line of the faxed order into the order management system to create the sales order.

Transcription errors on material codes, quantities or pricing

Time-consuming manual entry per line

4. Order validation and error handling

Customer service · SAP S/4

The system and agent check the keyed order for errors, and any failures are corrected manually before the order can progress.

Elevated failure rate relative to electronic channels

Rework loops and customer call-backs to confirm details

WITH THE CHANGE

1. Identify and segment fax-reliant accounts

Customer service · SAP S/4

Accounts still submitting by fax under derogation are identified and segmented by readiness to move to EDI or the portal.

2. Migrate accounts to electronic channels

Onboarding team · EDI / portal

Each fax-reliant account is onboarded to EDI or the customer portal following the standard onboarding process, retiring its fax derogation.

3. Customer submits order electronically

Retail customer · EDI / portal

The migrated customer transmits orders through EDI or the portal, where structured data is captured without manual re-keying.

4. Automated order creation and exception-only review

Customer service · SAP S/4

Orders flow automatically into the order management system with customer service intervening only on flagged exceptions rather than keying every order.

5. Monitor residual fax volume under controlled fallback

Customer service · SAP S/4

Any accounts that cannot migrate immediately are tracked under a controlled, time-boxed fallback so residual fax volume is visible and managed down.

Business impact. Fax orders processed under derogation require manual re-keying and exhibit an elevated failure rate compared with the automated EDI and portal channels

documented in the order flow analysis. Each failed fax order consumes additional customer service effort through rework, customer call-backs and escalation handling, while delaying order fulfilment. Migrating fax-reliant accounts to electronic channels removes the manual keying step entirely and brings these orders onto the lower-failure automated path, reducing both error volume and the customer service workload tied to fax exception handling.

How we get there: Impact is grounded in the order flow analysis, which records that fax orders are entered manually and carry a higher failure rate than electronic channels, and in the customer service escalation log, which captures the downstream rework these failures generate. No new numeric totals are asserted here beyond those verified facts.

How it's delivered. Begin by extracting the list of accounts still transacting by fax from the order flow analysis and the order management system, then prioritise them for migration using the standard retail customer onboarding process. Accounts with existing EDI capability or trading partners already in the integration register can be moved fastest; the remainder are directed to the customer portal. Retire each account's fax derogation only once its electronic channel is live and validated. For the residual tail that cannot move immediately, maintain a controlled, monitored fallback with explicit tracking so fax volume is continuously reduced rather than tolerated indefinitely.

Who uses it. Customer service agent, Onboarding team, Retail customer

Expected behaviour. Retail orders are received and created through automated electronic channels, with manual keying eliminated and fax intake reduced to a monitored, shrinking residual.

Escalation & human fallback. Residual fax orders that fail validation during the fallback period are routed to customer service for manual handling and tracked as exceptions until the originating account is migrated.

Sources. Order flow analysis export 2025, Retail customer onboarding guide, Order management SOP, EDI integration register, Customer service escalation log 2025 **Formats.** Fax orders, EDI messages, Portal order submissions

Connects: EDI, Customer portal, SAP S/4 order management

Success looks like:

- Reduction in the number of accounts operating under the fax derogation
- Reduction in fax order volume requiring manual keying
- Reduction in the fax-channel order failure rate toward parity with electronic channels
- Reduction in customer service escalations linked to fax order errors
- Increase in the share of retail orders received via EDI or the portal

Dependencies: Requires Address: EDI channel governs two-thirds of order flow yet sits outside every controlled procedure first.

Risks:

- Some customers may lack the technical capability or willingness to adopt EDI or the portal, slowing migration
- Removing the fax derogation before electronic channels are validated could disrupt order intake for affected accounts
- Residual fax volume may persist if fallback tracking is not enforced
- Onboarding capacity constraints could limit the pace of account migration

2 Horizon detail

H1 — Stabilise data integrity and visibility on the highest-exposure failures (0-6 months)

- **Reconcile customer master data to the single system of record** opportunity — 267 of 318 accounts carry credit-limit mismatches and 228 carry payment-terms mismatches between CRM and ERP, with an aggregate absolute credit-limit delta of EUR 30,675,000 (CRM total EUR 61,225,000 vs ERP total EUR 58,975,000). The credit-management policy already designates SAP S/4HANA as the sole authoritative source, so the corrective standard exists and only enforcement is missing.
- **Resolve the Carrefour France credit-limit discrepancy as a pilot case** opportunity — Carrefour France is the largest single discrepancy at EUR 600,000 (CRM EUR 2,400,000 vs ERP EUR 1,800,000), traced to a manual post-carve-out account-manager update. Resolving it first proves the reconciliation method on the highest-value exception.
- **Establish EDI fulfilment visibility and triage** opportunity — The EDI channel shows 1,196 not fulfilled orders worth EUR 12,362,493.74 and generated 34 'EDI order not processed' escalations (43% of EDI escalations), yet has no governing procedure. Standing up monitoring and a triage path addresses the failures that customers already feel.

H2 — Extend governed process coverage to the channels that move the volume (6-18 months)

- **Bring EDI into the official Order Management SOP and RACI** opportunity — EDI carries 67.3% of orders (5,667) and 66.8% of value (EUR 59,711,399.53) but is explicitly excluded from both the SOP and the O2C RACI, which today cover only manual telephone and email channels. Formalising ownership for the majority channel removes the structural cause of unprocessed orders.
- **Reduce dependency on third-party EDI connection support** opportunity — Working notes record that several EDI connections rely on the Sanofi IT helpdesk with a 24-to-48-hour turnaround, which lengthens resolution on a channel already producing the largest share of order value. Bringing this support in-scope shortens the path to fix failed orders.
- **Embed master-data controls into customer onboarding and change** opportunity — With the H1 reconciliation complete, preventing recurrence requires controls at the point of account creation and change so the 267-account mismatch condition does not rebuild. The onboarding guide and credit policy provide the standard to enforce.

H3 — Retire residual exceptions and sustain a single governed operating model (18+ months)

- **Phase out legacy fax order handling** opportunity — Fax accounts for 184 orders worth EUR 1,771,828.67, with 40 not fulfilled, and is accepted only under derogation for legacy accounts in certain markets. Once governed EDI and manual channels are stable, these residual orders can be migrated and the derogation closed.
- **Operate a unified, governed O2C and credit model across all channels** opportunity — With master data reconciled and controlled and EDI inside the SOP and RACI, the remaining step is sustained single-system-of-record operation across the full order base, closing the gap between the policy intent and day-to-day practice.

3 How the work connects

The enabling relationships between the opportunities — what unlocks what.

HOW THE OPPORTUNITIES ENABLE ONE ANOTHER

Arrows show enabling relationships; all paths lead to the target state.

4 Planning assumptions

The forward-looking elements of this roadmap — dates, owners, service levels, targets, cadence and sequence — are planning assumptions, not measured findings. They are shown here explicitly so they can be confirmed before delivery.

PLANNING ASSUMPTION — CONFIRM BEFORE DELIVERY

These forward-looking items are recommendations, not measured facts.

TYPE	ASSUMPTION	BASIS
SEQUENCING	Establish and publish a governed SOP covering the EDI channel, closing the documented gap where EDI is explicitly excluded from both the Order Management SOP and the O2C RACI.	EDI carries 67.3% of order volume (€59.7M) yet is explicitly excluded from the Order Management SOP and O2C RACI.
OWNERSHIP	Designate a single accountable owner for EDI order-flow monitoring and exception handling to reduce not fulfilled orders and the associated escalation volume.	1,196 EDI orders not fulfilled (€12,362,493.74) and 34 'EDI order not processed' escalations (43% of sample).
SEQUENCING	Run a customer master data reconciliation initiative enforcing SAP S/4HANA as the authoritative source, prioritising the largest deltas first (e.g. Carrefour France).	267 of 318 accounts show credit-limit mismatches; aggregate absolute delta €30,675,000; policy names SAP S/4HANA as sole authoritative source.

TYPE	ASSUMPTION	BASIS
SEQUENCING	Assess the legacy fax channel for retirement, given its low volume relative to its non-fulfilment rate.	<i>Fax handled 184 orders (€1,771,828.67), of which 40 were not fulfilled; accepted only under derogation per the 2023 SOP.</i>
SERVICE LEVEL	Note that resolution of EDI connection issues can depend on the Sanofi IT helpdesk with a 24–48 hour turnaround, which constrains how quickly some EDI exceptions can be cleared.	<i>Working notes state 6 of the EDI connections require Sanofi IT helpdesk contact, taking 24 to 48 hours.</i>
SERVICE LEVEL	Restoring certain EDI connections depends on contacting the Sanofi IT helpdesk, with a stated turnaround of 24 to 48 hours for the other connections.	<i>Working-notes quote: 'the other 6 connections ... you need to contact the Sanofi IT helpdesk ... it can take 24 to 48 hours'</i>
OWNERSHIP	SAP S/4HANA is intended to act as the single authoritative owner of all customer credit limits going forward.	<i>Credit-management policy: 'SAP S/4HANA is the sole authoritative source for all customer credit limits'</i>
SEQUENCING	EDI processing would need to be brought into the scope of the Order Management SOP and the O2C RACI, which currently cover only manual (telephone) and email channels.	<i>SOP: 'EDI is not covered by this version of the SOP'; RACI: 'This RACI covers Manual (telephone) and Email order channels only'</i>
OWNERSHIP	Establish S/4HANA as the enforced single source of record and lock down credit-limit and payment-term edits in CRM to eliminate manual overrides.	<i>Policy already names S/4HANA as sole authoritative source, yet 267 of 318 accounts show credit-limit drift from manual CRM edits.</i>
SERVICE LEVEL	Define a target resolution SLA for pricing-discrepancy and EDI-processing escalations to compress the current spread.	<i>Logged resolution times range from 3 to 67 hours with no apparent standard.</i>
OWNERSHIP	Bring EDI into the controlled SOP and RACI with a named process owner and a defined failure-recovery workflow.	<i>EDI is 67.3% of volume and EUR 59.71M of value but is excluded from all controlled procedures.</i>
SEQUENCING	Reduce reliance on the Sanofi IT helpdesk for EDI connections by migrating to an owned support route.	<i>Six EDI connections currently depend on the legacy Sanofi helpdesk with a stated 24-48 hour turnaround.</i>

TYPE	ASSUMPTION	BASIS
SEQUENCING	Plan retirement of the fax channel for legacy accounts and migrate them to governed channels.	184 fax orders persist under derogation with 40 not fulfilled.
SEQUENCING	Begin credit-limit and payment-terms remediation in the first delivery wave before EDI process and tooling work.	267 of 318 accounts have credit-limit mismatches and 228 accounts have payment-terms mismatches; downstream order validation depends on a clean master.
SERVICE LEVEL	Set a target response/recovery time for EDI integration failures faster than the current external helpdesk window.	Sanofi IT helpdesk recovery of failed EDI connections can take 24 to 48 hours.
OWNERSHIP	Assign master-data governance ownership to enforce S/4HANA as the single source and freeze manual CRM credit edits.	Policy states S/4HANA is the sole authoritative source; the Carrefour France discrepancy arose from a manual post-carve-out CRM edit.
CADENCE	Operate interim daily EDI not fulfilled exception reporting until automated monitoring is in place.	1,196 EDI orders worth EUR 12,362,493.74 are not fulfilled.
SEQUENCING	Prioritise remediation of the largest exposures first, starting with the Carrefour France EUR 600,000 discrepancy.	Largest single discrepancy is Carrefour FR at EUR 600,000 within an aggregate delta of EUR 30,675,000.
TARGET	Define a threshold for acceptable residual credit-limit delta to govern when remediation is considered complete.	Aggregate absolute credit-limit delta is currently EUR 30,675,000.
TIMING	H1 activities are scoped to a 0-6 month window.	267 of 318 accounts with credit-limit mismatches and 1,196 EDI not fulfilled orders represent active customer-facing exposure warranting earliest action.
TIMING	H2 activities are scoped to a 6-18 month window.	EDI carries 67.3% of orders and is excluded from the official SOP and RACI, requiring formal governance redesign that follows H1 stabilisation.

TYPE	ASSUMPTION	BASIS
TIMING	H3 activities are scoped to an 18+ month window.	<i>Fax represents only 184 orders accepted under derogation, making its retirement a lower-urgency step after channel governance is in place.</i>
OWNERSHIP	Accountability for the reconciliation and onboarding controls should sit with the credit-management function as data owner.	<i>The credit-management policy names SAP S/4HANA as the sole authoritative source for customer credit limits.</i>
SERVICE LEVEL	EDI order-failure triage should carry a target resolution SLA materially faster than current escalation outcomes.	<i>EDI 'order not processed' escalations are present (34 incidents) and current helpdesk dependency runs 24-48 hours.</i>
TARGET	A reconciliation completeness target (e.g. zero credit-limit and payment-terms mismatches) should govern H1 exit.	<i>Baseline of 267 credit-limit and 228 payment-terms mismatches across 318 accounts.</i>
CADENCE	EDI fulfilment monitoring should be reviewed on a recurring operational cadence.	<i>1,196 EDI not fulfilled orders worth EUR 12,362,493.74 indicate an ongoing failure pattern.</i>
SEQUENCING	Sequence: master-data reconciliation and EDI visibility precede SOP/RACI redesign, which precedes fax retirement and the unified operating model.	<i>EDI exclusion from the SOP and the 267-account mismatch are root conditions; fax (184 orders) is a residual exception dependent on prior channel governance.</i>
OWNERSHIP	Assign the O2C process owner as accountable for incorporating the EDI channel into the SOP and RACI.	<i>O2C RACI currently omits EDI accountability while covering other channels</i>
CADENCE	Establish a recurring review to keep the EDI integration register synchronised with the controlled SOP.	<i>Integration register is maintained outside any controlled procedure today</i>
SEQUENCING	Document the EDI intake flow in the SOP before formalising the dispute resolution procedure.	<i>Dispute handling currently depends on working notes that build on undocumented intake</i>
OWNERSHIP	Credit management to be designated as the owner of the authoritative credit limit source and the exception review.	<i>Credit limits are governed under the credit management policy.</i>

TYPE	ASSUMPTION	BASIS
TARGET	Target that 100% of active accounts show matching CRM and ERP credit limits after reconciliation.	<i>Verified finding that limits currently diverge on the large majority of accounts.</i>
CADENCE	Run the divergence exception report on a recurring schedule (e.g. weekly) to catch residual mismatches.	<i>Divergence is ongoing because the two systems are maintained independently.</i>
SERVICE LEVEL	Synchronise a credit limit change to the second system within an agreed time window of the change being saved.	<i>Order credit checks rely on the ERP value while account teams reference CRM.</i>
SEQUENCING	Complete the one-time reconciliation before enabling automated synchronisation to avoid propagating stale values.	<i>Existing accounts already diverge between the two systems.</i>
OWNERSHIP	Customer service leads to own the governed EDI recovery workflow with EDI integration owners accountable for permanent fixes to recurring causes.	<i>O2C RACI defines roles across the order-to-cash process; EDI integration register identifies integration ownership.</i>
SERVICE LEVEL	Define a target resolution time from automated failure detection to confirmed fulfillable sales order.	<i>Current recovery is reactive and undocumented in the EDI dispute working notes.</i>
TARGET	Set a target ceiling for the share of inbound EDI orders allowed to fail conversion before triggering escalation.	<i>Order flow analysis indicates EDI fulfilment failures occur at material scale.</i>
CADENCE	Establish a recurring review of failure causes fed back to integration owners.	<i>Recurring failure patterns appear across EDI dispute working notes and escalation log.</i>
SEQUENCING	Implement automated detection first, then layer the triage, resolution, and tracking workflow.	<i>Detection is currently ad hoc per the customer service working notes.</i>
OWNERSHIP	A master data steward should be designated as the owner of the payment-terms exception queue and the authoritative confirmation decision	<i>228 accounts require human adjudication of which term is correct</i>
TARGET	Define the authoritative system of record for payment terms (e.g. ERP customer master) before enabling automated write-back	<i>ERP terms drive invoicing while CRM terms are referenced commercially</i>

TYPE	ASSUMPTION	BASIS
CADENCE	Run the reconciliation on a recurring cadence to catch new drift after the initial 228-account backlog is cleared	<i>mismatch arises from updates made in one system only</i>
SEQUENCING	Clear the existing 228-account backlog first, then operate the reconciliation as an ongoing monitoring control	<i>228 currently mismatched accounts</i>
SERVICE LEVEL	Define target resolution-time SLAs per escalation category against which the workflow reports ageing.	<i>Escalation log shows long and variable resolution times today with no defined target</i>
OWNERSHIP	Assign a single accountable owner per escalation category derived from the O2C RACI before configuring routing.	<i>o2c-process-raci-the organisation-europe documents team responsibilities across O2C</i>
TARGET	Set an ageing threshold that triggers supervisor review for cases approaching their SLA.	<i>Supervisor monitoring step in the future process requires a defined escalation-of-escalation trigger</i>
CADENCE	Establish a regular review cadence of recurring escalation types from the standardised log.	<i>Standardised close notes enable root-cause analysis not possible today</i>
SEQUENCING	Codify RACI routing rules and migrate the existing escalation log before enabling automated classification.	<i>Auto-classification depends on agreed ownership rules and a clean structured log</i>
OWNERSHIP	Assign the onboarding team as accountable owner for migrating each fax-reliant account to EDI or the portal.	<i>Retail customer onboarding guide defines the onboarding process for electronic channels.</i>
TIMING	Set a target end date by which the fax derogation is fully retired for all migrated accounts.	<i>Fax orders currently persist under a temporary derogation from the standard channel policy.</i>
TARGET	Define a residual fax-volume threshold below which the controlled fallback is considered acceptable pending full migration.	<i>Order flow analysis records fax orders as a distinct, manually keyed channel with elevated failure rate.</i>
CADENCE	Review remaining fax accounts and residual fax volume on a regular cadence to track migration progress.	<i>Order flow analysis provides channel-level volume and failure data suitable for periodic monitoring.</i>
SERVICE LEVEL	Establish a handling SLA for any residual fax orders processed during the fallback period.	<i>Customer service escalation log shows fax errors generate downstream rework and escalations.</i>
